

# i.MX RT1060 Processor Reference Manual

With annotations for Teensy

Updated 8-Sep-2024

Document Number: IMXRT1060RM  
Rev. 3, 07/2021

## Contents

Section number	Title	Page
<b>Chapter 1 About this Document</b>		
1.1	Audience.....	21
1.2	Organization.....	21
1.3	Suggested Reading.....	21
1.4	Conventions.....	22
1.5	Register Access.....	24
1.6	Acronyms and Abbreviations.....	26
<b>Chapter 2 Introduction</b>		
2.1	Introduction.....	29
2.2	Features.....	31
2.3	Target Applications.....	33
2.4	Endianness Support.....	33
<b>Chapter 3 Memory Maps</b>		
3.1	Memory system overview.....	35
3.2	Arm Platform Memory Map.....	35
<b>Chapter 4 Interrupts, DMA Events, and XBAR Assignments</b>		
4.1	Chip-specific Interrupt information.....	43
4.2	Overview.....	43
4.3	CM7 interrupts.....	43
4.4	DMA Mux.....	52
4.5	PIT Channel Assignments For Periodic DMA Triggering.....	60
4.6	XBAR Resource Assignments.....	61
<b>Chapter 5 Direct Memory Access Multiplexer (DMAMUX)</b>		

<b>Section number</b>	<b>Title</b>	<b>Page</b>
5.1	Chip-specific DMAMUX information.....	75
5.2	Overview.....	75
5.3	Functional description.....	77
5.4	External signals.....	82
5.5	Initialization/application information.....	82
5.6	Memory map/register definition.....	85

## **Chapter 6 Enhanced Direct Memory Access (eDMA)**

6.1	Chip-specific eDMA information.....	89
6.2	Overview.....	89
6.3	Functional description.....	93
6.4	Initialization/application information.....	99
6.5	Memory map/register definition.....	114

## **Chapter 7 System Security**

7.1	Chapter overview.....	173
7.2	Feature summary.....	173
7.3	High-Assurance Boot (HAB).....	175
7.4	Secure Non-Volatile Storage (SNVS) module.....	177
7.5	Data Co-Processor (DCP).....	179
7.6	Standalone True Random Number Generator (TRNG).....	179
7.7	On-Chip OTP Controller (OCOTP_CTRL).....	179
7.8	Central Security Unit (CSU).....	180
7.9	System JTAG Controller (SJC).....	180
7.10	Bus Encryption Engine (BEE).....	181

## **Chapter 8 System Debug**

8.1	Overview.....	183
8.2	Chip and Arm Platform Debug Architecture.....	183
8.3	Miscellaneous.....	190

Section number	Title	Page
	<b>Chapter 9 System Boot</b>	
9.1	Chip-specific Boot Information.....	191
9.2	Overview.....	195
9.3	Boot modes.....	197
9.4	Device configuration.....	201
9.5	Device initialization.....	203
9.6	Boot devices.....	209
9.7	Program image.....	256
9.8	Plugin image.....	263
9.9	Serial Downloader.....	263
9.10	Recovery devices.....	274
9.11	SD/MMC manufacture mode.....	274
9.12	High-Assurance Boot (HAB).....	275
9.13	ROM APIs.....	276
	<b>Chapter 10 External Signals and Pin Multiplexing</b>	
10.1	Overview.....	289
	<b>Chapter 11 IOMUX Controller (IOMUXC)</b>	
11.1	Overview.....	317
11.2	Functional description.....	319
11.3	IOMUXC GPR Memory Map/Register Definition.....	323
11.4	IOMUXC SNVS Memory Map/Register Definition.....	376
11.5	IOMUXC SNVS GPR Memory Map/Register Definition.....	395
11.6	IOMUXC Memory Map/Register Definition.....	399
	<b>Chapter 12 General Purpose Input/Output (GPIO)</b>	
12.1	Chip-specific GPIO information.....	945
12.2	Overview.....	945

<b>Section number</b>	<b>Title</b>	<b>Page</b>
12.3	Functional Description.....	947
12.4	External Signals.....	956
12.5	Application Information.....	957
12.6	Memory Map/Register Definition.....	958

## **Chapter 13 Clock and Power Management**

13.1	Introduction.....	975
13.2	Device Power Management Architecture Components.....	975
13.3	Clock Management.....	978
13.4	Power management.....	987
13.5	ONOFF (Button).....	1001
13.6	WAKEUP Pin.....	1002

## **Chapter 14 Clock Controller Module (CCM)**

14.1	Chip-specific CCM information.....	1005
14.2	Overview.....	1005
14.3	External Signals.....	1008
14.4	CCM Clock Tree.....	1008
14.5	System Clocks.....	1011
14.6	Functional Description.....	1025
14.7	CCM Memory Map/Register Definition.....	1038
14.8	CCM Analog Memory Map/Register Definition.....	1089

## **Chapter 15 Crystal Oscillator (XTALOSC)**

15.1	Chip-specific XTALOSC information.....	1131
15.2	Overview.....	1131
15.3	External Signals.....	1132
15.4	Crystal Oscillator 24 MHz.....	1132
15.5	Crystal Oscillator 32 kHz.....	1134
15.6	XTALOSC 24MHz Memory Map/Register Definition.....	1136

Section number	Title	Page
<b>Chapter 16 Power Management Unit (PMU)</b>		
16.1	Chip-specific PMU information.....	1149
16.2	Overview.....	1150
16.3	Analog LDO Regulators.....	1151
16.4	USB LDO Regulator.....	1153
16.5	SNVS Regulator.....	1153
16.6	PMU Memory Map/Register Definition.....	1154
<b>Chapter 17 General Power Controller (GPC)</b>		
17.1	Chip-specific GPC information.....	1179
17.2	Overview.....	1179
17.3	Clocks.....	1180
17.4	Power Gating Control (PGC).....	1180
17.5	GPC Interrupt Controller (INTC).....	1183
17.6	GPC Memory Map/Register Definition.....	1184
17.7	PGC Memory Map/Register Definition.....	1190
<b>Chapter 18 DCDC Converter (DCDC)</b>		
18.1	Chip-specific DCDC information.....	1199
18.2	Overview.....	1200
18.3	Functional description.....	1201
18.4	Application information.....	1202
18.5	Memory Map and register definition.....	1204
<b>Chapter 19 Temperature Monitor (TEMPMON)</b>		
19.1	Chip-specific TEMP MON information.....	1215
19.2	Overview.....	1215
19.3	Software Usage Guidelines.....	1217
19.4	TEMPMON Memory Map/Register Definition.....	1218

Section number	Title	Page
<b>Chapter 20 Secure Non-Volatile Storage (SNVS)</b>		
20.1	Chip-specific SNVS information.....	1225
20.2	Overview.....	1225
20.3	SNVS functional description.....	1227
20.4	External Signals.....	1232
20.5	Initialization of SNVS.....	1233
20.6	Memory Map and register definition.....	1234
<b>Chapter 21 System Reset Controller (SRC)</b>		
21.1	Chip-specific SRC information.....	1261
21.2	Overview.....	1261
21.3	Functional Description.....	1262
21.4	External Signals.....	1271
21.5	Initialization.....	1272
21.6	SRC Memory Map/Register Definition.....	1273
<b>Chapter 22 Fusemap</b>		
22.1	Boot Fusemap.....	1287
22.2	Lock Fusemap.....	1298
22.3	Fusemap Descriptions Table.....	1299
<b>Chapter 23 On-Chip OTP Controller (OCOTP_CTRL)</b>		
23.1	Chip-specific OCOTP_CTRL information.....	1311
23.2	Overview.....	1311
23.3	Functional Description.....	1312
23.4	External Signals.....	1319
23.5	Fuse Map.....	1319
23.6	Memory Map/Register Definition.....	1319

## Chapter 24

Section number	Title	Page
	<b>External Memory Controllers</b>	
24.1	Overview.....	1355
24.2	Smart External Memory Controller (SEMC) Overview.....	1355
24.3	eMMC/eSD/SDIO.....	1356
24.4	Quad Serial Peripheral Interface.....	1357
	<b>Chapter 25 Smart External Memory Controller (SEMC)</b>	
25.1	Chip-specific SEMC information.....	1359
25.2	Overview.....	1359
25.3	Functional Description.....	1362
25.4	External Signals.....	1402
25.5	Initialization.....	1405
25.6	Application Information.....	1405
25.7	Memory Map and Register Definition.....	1408
	<b>Chapter 26 Ultra Secured Digital Host Controller (uSDHC)</b>	
26.1	Chip-specific uSDHC information.....	1465
26.2	Overview.....	1465
26.3	Functional description.....	1468
26.4	External signals.....	1501
26.5	Application of uSDHC.....	1502
26.6	Software restrictions.....	1528
26.7	uSDHC memory map/register definition.....	1530
	<b>Chapter 27 FlexSPI Controller</b>	
27.1	Chip-specific FlexSPI information.....	1601
27.2	Overview.....	1602
27.3	Functional description.....	1603
27.4	External Signals.....	1653
27.5	Initialization.....	1655

Section number	Title	Page
27.6	Application information.....	1655
27.7	Memory Map and register definition.....	1666
27.8	AHB Memory Map definition.....	1753

## **Chapter 28 ARM Cortex M7 Platform**

28.1	Chip-specific Arm Cortex M7 information.....	1755
28.2	Overview.....	1756
28.3	Functional Description.....	1757
28.4	External Signals.....	1758
28.5	Memory Map and register definition.....	1758

## **Chapter 29 Network Interconnect Bus System (NIC-301)**

29.1	Chip-specific NIC-301 information.....	1763
29.2	Overview .....	1763
29.3	External Signals.....	1764
29.4	Memory Map and Register Definition.....	1764

## **Chapter 30 On-Chip RAM Memory Controller (OCRAM)**

30.1	Chip-specific OCRAM information.....	1775
30.2	Overview.....	1775
30.3	Functional Description.....	1777
30.4	Programmable Registers.....	1779

## **Chapter 31 FlexRAM**

31.1	Chip-specific FlexRAM information.....	1781
31.2	Overview.....	1782
31.3	Functional description.....	1783
31.4	Memory Map and register definition.....	1786

## **Chapter 32 AHB to IP Bridge (AIPSTZ)**

<b>Section number</b>	<b>Title</b>	<b>Page</b>
32.1	Chip-specific AIPSTZ information.....	1793
32.2	Overview.....	1793
32.3	Clocks.....	1794
32.4	Functional Description.....	1794
32.5	Access Protections.....	1795
32.6	Access Support.....	1795
32.7	Initialization Information.....	1796
32.8	AIPSTZ Memory Map/Register Definition.....	1798

### **Chapter 33 Display and Camera Overview**

33.1	Overview.....	1815
------	---------------	------

### **Chapter 34 CMOS Sensor Interface (CSI)**

34.1	Chip-specific CSI information.....	1817
34.2	Overview.....	1817
34.3	Functional Description.....	1819
34.4	External Signals.....	1833
34.5	Initialization.....	1835
34.6	CSI Memory Map/Register Definition.....	1835

### **Chapter 35 Enhanced LCD Interface (eLCDIF)**

35.1	Chip-specific eLCDIF information.....	1857
35.2	Overview.....	1857
35.3	Functional Description.....	1859
35.4	External Signals.....	1876
35.5	Initialization.....	1877
35.6	eLCDIF Memory Map/Register Definition.....	1877

### **Chapter 36 Pixel Pipeline (PXP)**

36.1	Chip-specific PXP information.....	1905
------	------------------------------------	------

<b>Section number</b>	<b>Title</b>	<b>Page</b>
36.2	Overview.....	1905
36.3	Functional Description.....	1906
36.4	External Signals.....	1941
36.5	Initialization.....	1941
36.6	PXP Memory Map/Register Definition.....	1941

## **Chapter 37 Audio Overview**

37.1	Audio Overview.....	1979
------	---------------------	------

## **Chapter 38 Synchronous Audio Interface (SAI)**

38.1	Chip-specific SAI information.....	1985
38.2	Overview.....	1986
38.3	Functional description.....	1988
38.4	External signals.....	1999
38.5	Memory map and register definition.....	1999

## **Chapter 39 Medium Quality Sound (MQS)**

39.1	Chip-specific MQS information.....	2035
39.2	Overview.....	2035
39.3	Functional Description.....	2036
39.4	External Signals.....	2037
39.5	Application Information.....	2038

## **Chapter 40 Sony/Philips Digital Interface (SPDIF)**

40.1	Chip-specific SPDIF information.....	2039
40.2	Overview.....	2039
40.3	Functional Description.....	2041
40.4	External Signals.....	2051
40.5	Application Information.....	2052
40.6	SPDIF Memory Map/Register Definition.....	2053

Section number	Title	Page
	<b>Chapter 41 10/100-Mbps Ethernet MAC (ENET)</b>	
41.1	Chip-specific ENET information.....	2079
41.2	Overview.....	2079
41.3	Functional description.....	2083
41.4	External Signals.....	2144
41.5	Memory map/register definition.....	2146
	<b>Chapter 42 Universal Serial Bus Controller (USB)</b>	
42.1	Chip-specific USB information.....	2251
42.2	Overview.....	2251
42.3	External Signals.....	2254
42.4	Functional Description.....	2255
42.5	USB Operation Model.....	2259
42.6	USB Non-Core Memory Map/Register Definition.....	2424
42.7	USB Core Memory Map/Register Definition.....	2433
	<b>Chapter 43 Universal Serial Bus 2.0 Integrated PHY (USB-PHY)</b>	
43.1	Chip-specific USB-PHY information.....	2511
43.2	USB PHY Overview.....	2511
43.3	Operation.....	2511
43.4	USB PHY Memory Map/Register Definition.....	2522
43.5	USB Analog Memory Map/Register Definition.....	2539
	<b>Chapter 44 Flexible Controller Area Network (FLEXCAN)</b>	
44.1	Chip-specific FLEXCAN information.....	2561
44.2	Overview.....	2561
44.3	External Signals.....	2566
44.4	Clocks.....	2567
44.5	Message Buffer Structure.....	2568

<b>Section number</b>	<b>Title</b>	<b>Page</b>
44.6	Rx FIFO Structure.....	2572
44.7	Functional Description.....	2575
44.8	Initialization/Application Information.....	2602
44.9	FLEXCAN Memory Map/Register Definition.....	2603

## **Chapter 45** **Flexible Data-rate Controller Area Network (CANFD/FlexCAN3)**

45.1	Chip-specific FLEXCAN information.....	2647
45.2	Overview.....	2647
45.3	Functional description.....	2650
45.4	FlexCAN signal descriptions.....	2706
45.5	Initialization/application information.....	2707
45.6	Memory map/register definition.....	2708

## **Chapter 46** **Keypad Port (KPP)**

46.1	Chip-specific KPP information.....	2773
46.2	Overview .....	2773
46.3	Functional Description.....	2775
46.4	External Signals.....	2783
46.5	Initialization/Application Information.....	2785
46.6	Memory Map and Register Definition.....	2786

## **Chapter 47** **Low Power Inter-Integrated Circuit (LPI2C)**

47.1	Chip-specific LPI2C information.....	2793
47.2	Overview.....	2793
47.3	Functional description.....	2796
47.4	Signal descriptions.....	2808
47.5	Memory Map and Registers.....	2809

## **Chapter 48** **Low Power Serial Peripheral Interface (LPSPI)**

48.1	Chip-specific LPSPI information.....	2853
------	--------------------------------------	------

<b>Section number</b>	<b>Title</b>	<b>Page</b>
48.2	Overview.....	2853
48.3	Functional description.....	2855
48.4	Signal descriptions.....	2866
48.5	Memory map and registers.....	2867

## **Chapter 49 Low Power Universal Asynchronous Receiver/Transmitter (LPUART)**

49.1	Chip-specific LPUART information.....	2893
49.2	Overview.....	2893
49.3	Functional description.....	2896
49.4	Clocking and Resets.....	2914
49.5	External signals.....	2914
49.6	Register definition.....	2915

## **Chapter 50 Flexible I/O (FlexIO)**

50.1	Chip-specific FlexIO information.....	2943
50.2	Overview.....	2944
50.3	Functional description.....	2946
50.4	Application Information.....	2959
50.5	FlexIO Signal Descriptions.....	2978
50.6	Memory Map and Registers.....	2978

## **Chapter 51 Timers Overview**

51.1	Overview.....	3009
------	---------------	------

## **Chapter 52 General Purpose Timer (GPT)**

52.1	Chip-specific GPT information.....	3013
52.2	Overview.....	3013
52.3	External Signals.....	3015
52.4	Clocks.....	3016
52.5	Functional Description.....	3018

<b>Section number</b>	<b>Title</b>	<b>Page</b>
52.6	Initialization/ Application Information .....	3022
52.7	Memory map and register definitions.....	3023
<b>Chapter 53 Periodic Interrupt Timer (PIT)</b>		
53.1	Chip-specific PIT information.....	3035
53.2	Introduction.....	3035
53.3	Modes of operation.....	3037
53.4	Functional description.....	3037
53.5	Initialization and application information.....	3041
53.6	PIT register descriptions.....	3042
<b>Chapter 54 Quad Timer (TMR)</b>		
54.1	Chip-specific TMR information.....	3051
54.2	Overview.....	3051
54.3	Modes of Operation.....	3053
54.4	Functional Description.....	3053
54.5	Resets.....	3070
54.6	Clocks.....	3070
54.7	Interrupts.....	3070
54.8	DMA.....	3072
54.9	Memory map/register definition.....	3073
<b>Chapter 55 Enhanced Flex Pulse Width Modulator (eFlexPWM)</b>		
55.1	Chip-specific FlexPWM information.....	3091
55.2	Overview.....	3091
55.3	Functional Description.....	3094
55.4	External Signals .....	3130
55.5	Resets.....	3132
55.6	Interrupts.....	3132
55.7	DMA.....	3134

<b>Section number</b>	<b>Title</b>	<b>Page</b>
55.8	PWM register descriptions.....	3135
<b>Chapter 56</b> <b>Quadrature Decoder (QDC)</b>		
56.1	Chip-specific QDC information.....	3209
56.2	Overview.....	3209
56.3	Functional Description.....	3213
56.4	Signal Descriptions.....	3225
56.5	Memory Map and Registers.....	3226
<b>Chapter 57</b> <b>Watchdog Timer (WDOG1-2)</b>		
57.1	Chip-specific WDOG information.....	3249
57.2	Overview.....	3249
57.3	External signals.....	3251
57.4	Clocks.....	3251
57.5	Watchdog mechanism and system integration.....	3252
57.6	Functional description.....	3252
57.7	Initialization.....	3260
57.8	WDOG Memory Map/Register Definition.....	3261
<b>Chapter 58</b> <b>RTWDOG (WDOG3)</b>		
58.1	Chip-specific RTWDOG information.....	3269
58.2	Overview.....	3270
58.3	Functional description.....	3271
58.4	Application Information.....	3278
58.5	Memory map and register definition.....	3279
<b>Chapter 59</b> <b>External Watchdog Monitor (EWM)</b>		
59.1	Chip-specific EWM information.....	3287
59.2	Overview.....	3287
59.3	Functional Description.....	3289

<b>Section number</b>	<b>Title</b>	<b>Page</b>
59.4	EWM Signal Descriptions.....	3294
59.5	Memory Map/Register Definition.....	3294
<b>Chapter 60 On Chip Cross Triggers Overview</b>		
60.1	Overview.....	3303
<b>Chapter 61 Inter-Peripheral Crossbar Switch A (XBARA)</b>		
61.1	Chip-specific XBAR information.....	3305
61.2	Overview.....	3305
61.3	Functional Description.....	3307
61.4	External Signals.....	3309
61.5	Memory Map and Register Descriptions.....	3310
<b>Chapter 62 Inter-Peripheral Crossbar Switch B (XBARB)</b>		
62.1	Chip-specific XBAR information.....	3351
62.2	Overview.....	3351
62.3	Functional Description.....	3352
62.4	External Signals.....	3352
62.5	Memory Map and Register Descriptions.....	3352
<b>Chapter 63 And-Or-Inverter (AOI)</b>		
63.1	Chip-specific AOI information.....	3359
63.2	Overview.....	3359
63.3	Functional Description.....	3362
63.4	External Signal Description.....	3365
63.5	Memory Map and Register Descriptions.....	3365
<b>Chapter 64 Analog Overview</b>		
64.1	Overview.....	3371
<b>Chapter 65</b>		

Section number	Title	Page
	<b>Analog Comparator (ACMP)</b>	
65.1	Chip-specific CMP information.....	3373
65.2	Introduction.....	3373
65.3	Memory map/register definitions.....	3378
65.4	Functional description.....	3384
65.5	CMP interrupts.....	3398
65.6	DMA support.....	3398
65.7	Digital-to-analog converter.....	3399
65.8	DAC functional description.....	3399
65.9	DAC resets.....	3400
65.10	DAC clocks.....	3400
65.11	DAC interrupts.....	3400
	<b>Chapter 66 Analog-to-Digital Converter (ADC)</b>	
66.1	Chip-specific ADC information.....	3401
66.2	Overview.....	3401
66.3	External Signals.....	3405
66.4	Clocks.....	3407
66.5	Functional Description.....	3407
66.6	Initialization Information.....	3422
66.7	Application Information.....	3424
66.8	Memory map and register definition.....	3428
	<b>Chapter 67 ADC External Trigger Control (ADC_ETC)</b>	
67.1	Chip-specific ADC_ETC information.....	3447
67.2	Overview.....	3447
67.3	Functional description.....	3450
67.4	Initialization.....	3453
67.5	Application information.....	3453
67.6	Memory Map and register definition.....	3456

Section number	Title	Page
<b>Chapter 68 Touch Screen Controller (TSC)</b>		
68.1	Chip-specific TSC information.....	3487
68.2	Overview.....	3487
68.3	Functional Description.....	3489
68.4	TSC Memory Map/Register Definition.....	3494

# Chapter 1

## About this Document

### 1.1 Audience

The reference manual is intended for the board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands the concepts of the digital system design, microprocessor architecture, input/output (I/O) devices, industry standard communication, and device interface protocols.

### 1.2 Organization

The reference manual describes the chip at a system level and provides an architectural overview. It also describes the system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

### 1.3 Suggested Reading

This section lists additional resources that provide background for the information in the reference manual, as well as general information about the architecture.

**Table 1-1. Suggested Reading**

Type	Description	Resource
Fact Sheet	The Fact Sheet is an overview of the product key features and its uses.	<a href="#">i.MX RT Series Crossover Processor Fact Sheet</a>

## 1.4 Conventions

The reference manual uses the following notational conventions:

### cleared / set

When a bit has a value of zero, it is said to be cleared; when it has a value of one, it is said to be set.

### mnemonics

Instruction mnemonics are shown in lowercase bold.

### italics

Italics indicate variable command parameters, for example, **bcctrx**.

The book titles in the text are set in italics.

### 15

An integer in decimal.

### 0x

the prefix to denote a hexadecimal number.

### 0b

The prefix to denote a binary number. Binary values of 0 and 1 are written without a prefix.

### n'H4000CA00

The n-bit hexadecimal number.

#### **BLK\_REG\_NAME**

The register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (\_).

#### **BLK\_REG[FIELD]**

The fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

#### **BLK\_REG[ n ]**

The bit number *n* within the BLK.REG register.

#### **BLK\_REG[ l:r ]**

The register bit ranges. The ranges are indicated by the left-most bit number *l* and the right-most bit number *r*, separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

#### **x, U**

In some contexts, such as signal encodings, an unitalicized x indicates a "don't care" or "uninitialized". The binary value can be 1 or 0.

#### **x**

An italicized *x* indicates an alphanumeric variable.

#### **n, m**

Italicized *n* or *m* represent integer variables.

#### **!**

Binary logic operator NOT.

#### **&&**

Binary logic operator AND.

#### **||**

Binary logic operator OR.

#### **^ or <O+>**

Binary logic operator XOR. For example, A <O+> B.

#### **|**

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value of 0b1001.

#### **&**

Bit-wise AND. For example, 0b0001 & 0b1000 yields the value of 0b0000.

#### **{A,B}**

Concatenation, where the *n*-bit value A is prepended to the *m*-bit value B to form an (*n* + *m*)-bit value. For example, {0, REGm [14:0]} yeilds a 16-bit value with 0 in the most significant bit.

#### **- or grey fill**

Indicates a reserved bit field in a register. Although these bits can be written to with ones or zeros, they always read zeros.

#### **>>**

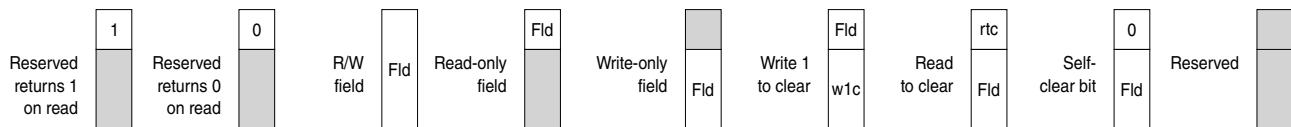

Shift right logical one position.

<< Shift left logical one position.  
<= Assignment.  
== Compare equal.  
!= Compare not equal.  
> Greater than.  
< Less than.

## 1.5 Register Access

### 1.5.1 Register Diagram Field Access Type Legend

This figure provides the interpretation of the notation used in the register diagrams for a number of common field access types:

**Figure 1-1. Register Field Conventions**

#### NOTE

For reserved register fields, the software should mask off the data in the field after a read (the software can't rely on the contents of data read from a reserved field) and always write all zeros.

### 1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all the bits set to 1 perform the associated operation on the primary register, while the bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one-bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read-modify-write operations. When an atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

A set of SCT registers is offered for registers in many modules on this device, as described in this manual. In a module memory map table, the suffix \_SET, \_CLR, or \_TOG is added to the base name of the register. For example, the CCM\_ANALOG\_PLL\_ARM register has three other registers called CCM\_ANALOG\_PLL\_ARM\_SET, CCM\_ANALOG\_PLL\_ARM\_CLR, and CCM\_ANALOG\_PLL\_ARM\_TOG.

In the sub-section that describes one of these sets of registers, a short-hand convention is used to denote that a register has the SCT register set. There is an italicized *n* appended to the end of the short register name. Using the above example, the name used for this register is CCM\_ANALOG\_PLL\_ARM*n*. When you see this designation, there is a SCT register set associated with the register, and you can verify this by checking it in the memory map table. The address offset for each of these registers is given in the form of the following example:

Address: 20C\_8000h base + 0h offset + (4d × i), where i=0d to 3d

## Acronyms and Abbreviations

In this example, the address for each of the base registers and their three SCT registers can be calculated as:

Register	Address
CCM_ANALOG_PLL_ARM	20C_8000h
CCM_ANALOG_PLL_ARM_SET	20C_8004h
CCM_ANALOG_PLL_ARM_CLR	20C_8008h
CCM_ANALOG_PLL_ARM_TOG	20C_800Ch

## 1.6 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

### Acronyms and Abbreviated Terms

Term	Meaning
ACMP	Analog Comparator
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	Arm IP Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BEE	Bus Encryption Engine
CA/CM	Arm Cortex-A/Cortex-M
CAN	Controller Area Network
CCM	Clock Controller Module
CM7	Arm Cortex M7 Core
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DCP	Data Co-Processor
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory

Table continues on the next page...

Term	Meaning
ECC	Error correcting codes
LPSPI	Low-power SPI
EDMA	Enhanced Direct Memory Access
EIM	External Interface Module
ENET	Ethernet
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable Programmable Read-Only Memory
ETF	Embedded Trace FIFO
ETM	Embedded Trace Macrocell
FIFO	First-In-First-Out
GIC	General Interrupt Controller
GPC	General Power Controller
GPIO	General-Purpose I/O
GPR	General-Purpose Register
GPS	Global Positioning System
GPT	General-Purpose Timer
GPU	Graphics Processing Unit
GPV	Global Programmers View
HAB	High-Assurance Boot
I2C or I <sup>2</sup> C	Inter-Integrated Circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IOMUX	Input-Output Multiplexer
IP	Intellectual Property
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
ELCDIF	Liquid Crystal Display Interface
LDO	Low-Dropout
LIFO	Last-In-First-Out
LRU	Least-Recently Used
LSB	Least-Significant Byte
LUT	Look-Up Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MCM	Miscellaneous Control Module
MMC	Multimedia Card
MSB	Most-Significant Byte
MT/s	Mega Transfers per second
OCRAM	On-Chip Random-Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCI	Peripheral Component Interconnect

*Table continues on the next page...*

## Acronyms and Abbreviations

Term	Meaning
PCIe	PCI express
PGC	Power Gating Controller
PIC	Programmable Interrupt Controller
PMU	Power Management Unit
POR	Power-On Reset
PSRAM	Pseudo-Static Random Access Memory
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced Instruction Set Computing
ROM	Read-Only Memory
RTOS	Real-Time Operating System
Rx	Receive
SAI	Synchronous Audio Interface
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous Data Link Control
SDMA	Smart DMA
SIM	Subscriber Identification Module
SNVS	Secure Non-Volatile Storage
SoC	System-on-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Philips Digital Interface
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory
SRC	System Reset Controller
TFT	Thin-Film Transistor
TPIU	Trace Port Interface Unit
TSGEN	Time Stamp Generator
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

# **Chapter 2**

## **Introduction**

### **2.1 Introduction**

The i.MX RT1060 is a new processor family featuring NXP's advanced implementation of the high performance Arm Cortex®-M7 Core. It offers high-performance processing optimized for lowest power consumption and best real-time response.

This device provides various memory interfaces, including SDRAM, Raw NAND FLASH, NOR FLASH, SD/eMMC, Quad SPI (FlexSPI), and a wide range of other interfaces for connecting peripherals, such as WLAN, Bluetooth™, displays, camera sensors, and GPS. Same as other i.MX processors, this i.MX RT series also has rich audio and video features, including LCD display, basic 2D graphics, camera interface, SPDIF and I2S audio interface.

#### **2.1.1 Block Diagram**

The functional block diagram is shown in the figure below. This diagram provides a view of the chip's major functional components and core complexes.

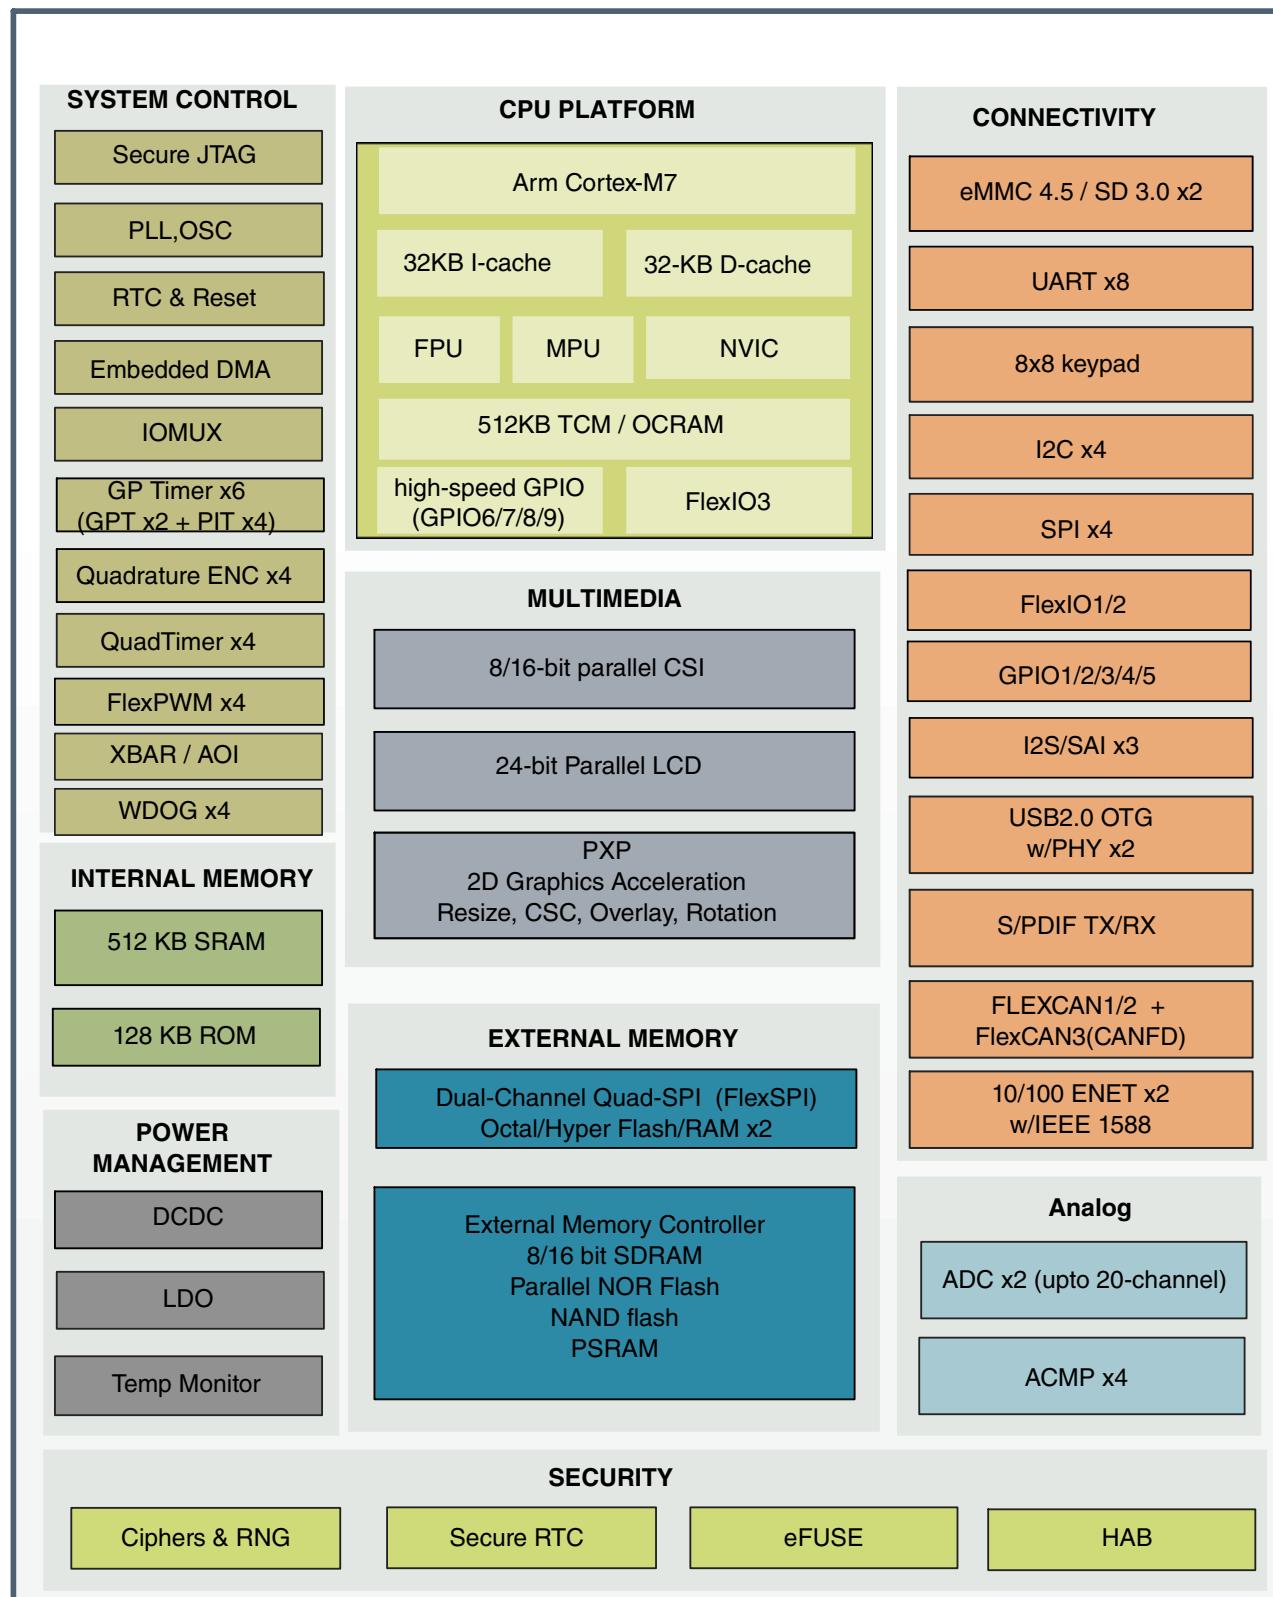

Figure 2-1. Simplified Block Diagram

## 2.2 Features

The i.MX RT1060 processors are based on Arm® Cortex®-M7 Platform, which have the following features:

Single Arm Cortex-M7 with:

- 32KB L1 Instruction Cache
- 32KB L1 Data Cache
- Single-precision and double-precision FPU (Floating Point Unit)
- Integrated Memory Protection Unit (MPU), up to 16 individual protection regions
- Tightly coupled GPIOs (GPIO6/7/8/9), operating at the same frequency as Arm
- Up to 512KB I-TCM and D-TCM in total

On Chip Memory:

- Boot ROM (128KB)
- On-chip RAM, configurable RAM up to 1MB (512KB OCRAM shared between ITCM/DTCM and OCRAM, as well as dedicated 512KB OCRAM)

External Memory Interfaces:

- 8/16-bit SDRAM, up to SDRAM-166
- 8-bit SLC NAND FLASH, with ECC handled in software
- SD/eMMC
- ×2 Single/Dual channel Quad SPI FLASH with XIP support
- Parallel NOR FLASH with XIP support
- SPI NOR/NAND FLASH

Graphics:

- Generic 2D Graphics engine (PXP)
  - BitBlit
  - Flexible image composition options – alpha, chroma key
  - Image rotation (90, 180, 270 degree rotation)
  - Porter-Duff operation
  - Image resize
  - Color space conversion
  - Multiple pixel format support (RGB, YUV444, YUV422, YUV420, YUV400)
  - Standard 2D-DMA operation

Display Interface:

- Parallel RGB LCD interface
  - Support 8-/16-/24-bit interface
  - Support up to WXGA resolution

## Features

- Smart LCD Display with 8/16-bit MPU/8080 interface
- Support Index color with 256 entry × 24 bit color LUT

### Camera Sensor Interface:

- Support 8/16/24-bit CSI Input

### Audio:

- SPDIF Input and Output
- 3x SAI (synchronous audio interface) modules supporting I2S, AC97, TDM, and Codec/DSP interfaces
- MQS interface for medium quality audio via GPIO pads

### Connectivity:

- 2x USB 2.0 OTG controller with integrated PHY interfaces
- 2x Ultra Secure Digital Host Controller (uSDHC) interfaces
- 2x 10M/100M Ethernet controller with support for IEEE1588
- 8x Universal asynchronous receiver/transmitter (UARTs) modules
- 4x I2C modules
- 4x SPI modules
- 2x FlexCAN modules
- 1x FlexCAN module with Flexible Data-rate support (CANFD/FlexCAN3)
- 3x FlexIO modules

### Timers:

- 2x General Programmable Timer (GPT)
- 4-channel Periodical Interrupt Timer (PIT)
- 4x Quad Timer (QTimer)
- 4x FlexPWM

### Analog:

- 2x Analog-Digital-Converters (ADC) (up to 20 channels)
- 4x Analog Comparators (ACMP)

### Security:

- High Assurance Boot (HAB)
- Data Co-Processor (DCP)
  - AES-128, ECB, and CBC mode
  - SHA-1 and SHA-256
  - CRC-32
- Bus Encryption Engine (BEE)
  - AES-128, ECB, and CTR mode
  - On-the-fly QSPI Flash decryption
- True Random Number Generator (TRNG)
- Secure Non-volatile Storage (SNVS)

- Secure real-time clock (RTC)
- Secure JTAG Controller (SJC)

System Debug:

- Arm CoreSight debug and trace architecture
- Trace Port Interface Unit (TPIU) to support off-chip real-time trace
- Cross Triggering Interface (CTI)
- Support for 5-pin (JTAG) and SWD debug interfaces

Power Management:

- Full PMIC integration, including on-chip DCDC and LDO
- Temperature sensor with programmable trim points
- GPC hardware power management controller

## 2.3 Target Applications

This processor can be used in areas such as industrial HMI, IoT, motor control and home appliances, etc.

The architecture's flexibility enables it to be used in a wide variety of other general embedded applications too. This processor provides all interfaces necessary to connect peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

## 2.4 Endianness Support

The chip supports only the Little Endian mode.

# Chapter 3

## Memory Maps

### 3.1 Memory system overview

This section introduces the memory architecture of the chip.

#### NOTE

Accessing the reserved memory regions can result in unpredictable behavior.

### 3.2 Arm Platform Memory Map

The chip memory map has been provided in the following tables.

Table 3-1. System memory map (CM7)

Start Address	End Address	Size	Description
E010_0000	FFFF_FFFF	511MB	Reserved
E000_0000	E00F_FFFF	1MB	CM7 PPB ARM peripherals
8000_0000	DFFF_FFFF	1.5GB	SEMC external memories (SDRAM, NOR, PSRAM, NAND and 8080) shared memory space
7FC0_0000	7FFF_FFFF	4MB	FlexSPI RX FIFO
7F80_0000	7FBF_FFFF	4MB	FlexSPI TX FIFO
7F40_0000	7F7F_FFFF	4MB	FlexSPI2 RX FIFO
7F00_0000	7F3F_FFFF	4MB	FlexSPI2 TX FIFO
7000_0000	7EFF_FFFF	240MB	FlexSPI2/ FlexSPI2 ciphertext PSRAM (EXTMEM)
6000_0000	6FFF_FFFF	256MB	FlexSPI/ FlexSPI ciphertext Flash (PROGMEM, FLASHMEM)
4800_0000	5FFF_FFFF	384MB	Reserved
4400_0000	47FF_FFFF	64MB	Reserved
4200_00004210_000	43FF_FFFF	32MB31MB	Reserved
4200_0000	420F_FFFF	1MB	AIPS-5 Low latency peripherals (sadly, no DMA access)

Table continues on the next page...

**Table 3-1. System memory map (CM7) (continued)**

Start Address	End Address	Size	Description
4180_0000	41FF_FFFF	8MB	Reserved
4170_0000	417F_FFFF	1MB	GPV Reserved

**NOTE**

Accessing the reserved memory regions can result in unpredictable behavior.

# Chapter 4

## Interrupts, DMA Events, and XBAR Assignments

### 4.1 Chip-specific Interrupt information

Table 4-1. Reference links to related information

Topic	Related module or subsystem	Reference
System memory map	-	<a href="#">System Memory Map</a>
Clocking	CCM	<a href="#">Clock Management</a> <a href="#">Clock Control Module (CCM)</a>
Audio Subsystem	Audio Subsystem	<a href="#">Audio Subsystem Overview</a>
Power management	PMU	<a href="#">Power Management</a> <a href="#">Power Management Unit</a>
Signal multiplexing	IOMUX	<a href="#">External Signals and Pin Multiplexing</a> <a href="#">IOMUX</a>
Interrupts, DMA Events and XBAR Assignments	-	<a href="#">Interrupts, DMA Events and XBAR Assignments</a>

### 4.2 Overview

This section describes the Interrupt assignments, DMA events, and XBAR resource assignments.

### 4.3 CM7 interrupts

The Nested Vectored Interrupt Controller (NVIC) collects interrupt request sources and provides an interface to the Cortex-M7 core.

The table below describes the Cortex-M7 interrupt sources:

**NOTE**

Due to the clock frequency difference between CPU and peripheral, in some corner case, peripheral interrupt flag may not be really cleared before CPU exit ISR. In such case, user should add DSB instruction right after instruction to clear interrupt flag.

**Table 4-2. CM7 domain interrupt summary**

IRQ	Module	Logic	Description
0	eDMA	OR	eDMA Channel 0 Transfer Complete
			eDMA Channel 16 Transfer Complete

158-159	Reserved	-	Reserved

## 4.4 DMA Mux

The table below shows the DMA request signals for the peripherals in the chip:

**Table 4-3. DMA MUX Mapping**

Channel	Module	Logic	Description
0	FLEXIO1	OR	FlexIO DMA Request 0
		OR	FlexIO Async DMA Request 0

*Table continues on the next page...*

**Table 4-3. DMA MUX Mapping (continued)**

Channel	Module	Logic	Description
		OR	FlexIO DMA Request 1
		OR	FlexIO Async DMA Request 1
1	FLEXIO2	OR	FlexIO DMA Request 0
		OR	FlexIO Async DMA Request 0
		OR	FlexIO DMA Request 1
		OR	FlexIO Async DMA Request 1
2	LPUART1	OR	UART TX FIFO DMA Request
		OR	UART TX FIFO Async DMA Request
3	LPUART1	OR	UART RX FIFO DMA Request
		OR	UART RX FIFO Async DMA Request
4	LPUART3	OR	UART TX FIFO DMA Request
		OR	UART TX FIFO Async DMA Request
5	LPUART3	OR	UART RX FIFO DMA Request

## 4.5 PIT Channel Assignments For Periodic DMA Triggering

This table shows the PIT channel to DMA channel correspondence.

**Table 4-4. PIT Channel Assignments For Periodic DMA Triggering**

DMA Channel Number	PIT Channel
eDMA Channel 0	PIT Channel 0
eDMA Channel 1	PIT Channel 1
eDMA Channel 2	PIT Channel 2
eDMA Channel 3	PIT Channel 3

## 4.6 XBAR Resource Assignments

This table shows the XBAR resource assignments in the chip.

### NOTE

ADC\_ETC0\_COCO0 ... ADC\_ETC1\_COCO3 in the table are corresponding to coco0 ... coco7, also ADC\_ETC\_TRIG00 ... ADC\_ETC\_TRIG13 corresponding to trg0 ... trg7, see the figure "ADC\_ETC block diagram" in the ADC\_ETC chapter.

**Table 4-5. XBAR1 Input Assignments**

DMA Mux Mapping	DMAMUX	<a href="#">DMA Mux</a>

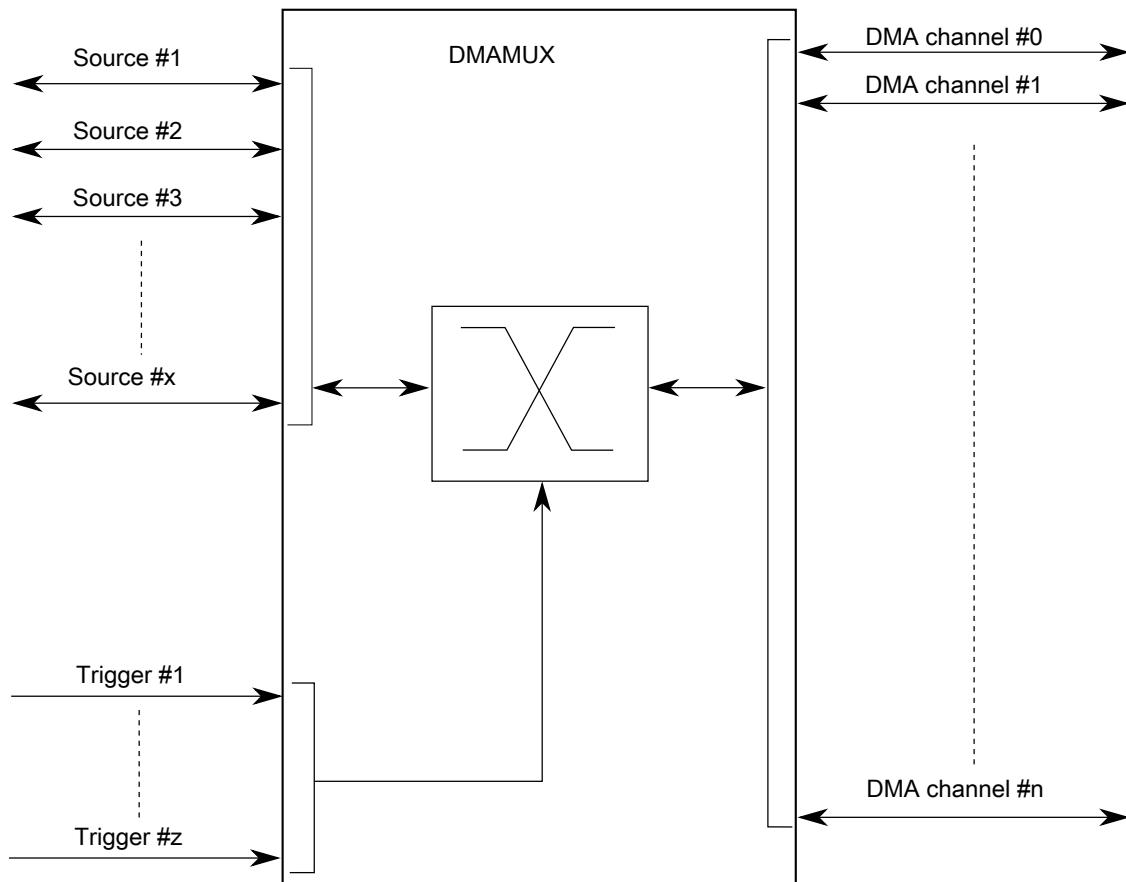

See the "DMA MUX Mapping" table in the "Interrupts, DMA Events, and XBAR Assignments" chapter for details about DMA source and channel information.

### 5.2 Overview

The Direct Memory Access Multiplexer (DMAMUX) routes DMA sources, called slots, to any of the 32 DMA channels.

#### 5.2.1 Block diagram

The following figure illustrates the block diagram of DMAMUX.

**Figure 5-1. DMAMUX block diagram**

## 5.2.2 Features

The DMAMUX module provides these features:

- Up to 128 peripheral slots can be routed to 32 channels.
- 32 independently selectable DMA channel routers.
  - Each channel output can be individually configured to be Always On and not depend on any of the peripheral slots.
  - The first 4 channels additionally provide a trigger functionality.
- Each channel router can be assigned to one of the possible peripheral DMA slots.
- On every memory map configuration change for any channel, this module signals to the DMA Controller to reset the internal state machine for that channel and it can accept a new request based on the new configuration.

## 5.3 Functional description

The primary purpose of the DMAMUX is to provide flexibility in the system's use of the available DMA channels.

As such, configuration of the DMAMUX is intended to be a static procedure done during execution of the system boot code. However, if the procedure outlined in [Enabling and configuring sources](#) is followed, the configuration of the DMAMUX may be changed during the normal operation of the system.

Functionally, the DMAMUX channels may be divided into two classes:

- Channels that implement the normal routing functionality plus periodic triggering capability
- Channels that implement only the normal routing functionality

### 5.3.1 Modes of operation

The following operating modes are available:

- Disabled mode

In this mode, the DMA channel is disabled. Because disabling and enabling of DMA channels is done primarily via the DMA configuration registers, this mode is used mainly as the reset state for a DMA channel in the DMA channel MUX. It may also be used to temporarily suspend a DMA channel while reconfiguration of the system takes place, for example, changing the period of a DMA trigger.

- Normal mode

In this mode, a DMA source is routed directly to the specified DMA channel. The operation of the DMAMUX in this mode is completely transparent to the system.

- Periodic Trigger mode

In this mode, a DMA source may only request a DMA transfer, such as when a transmit buffer becomes empty or a receive buffer becomes full, periodically.

Configuration of the period is done in the registers of the periodic interrupt timer (PIT). This mode is available only for channels 0 to 3.

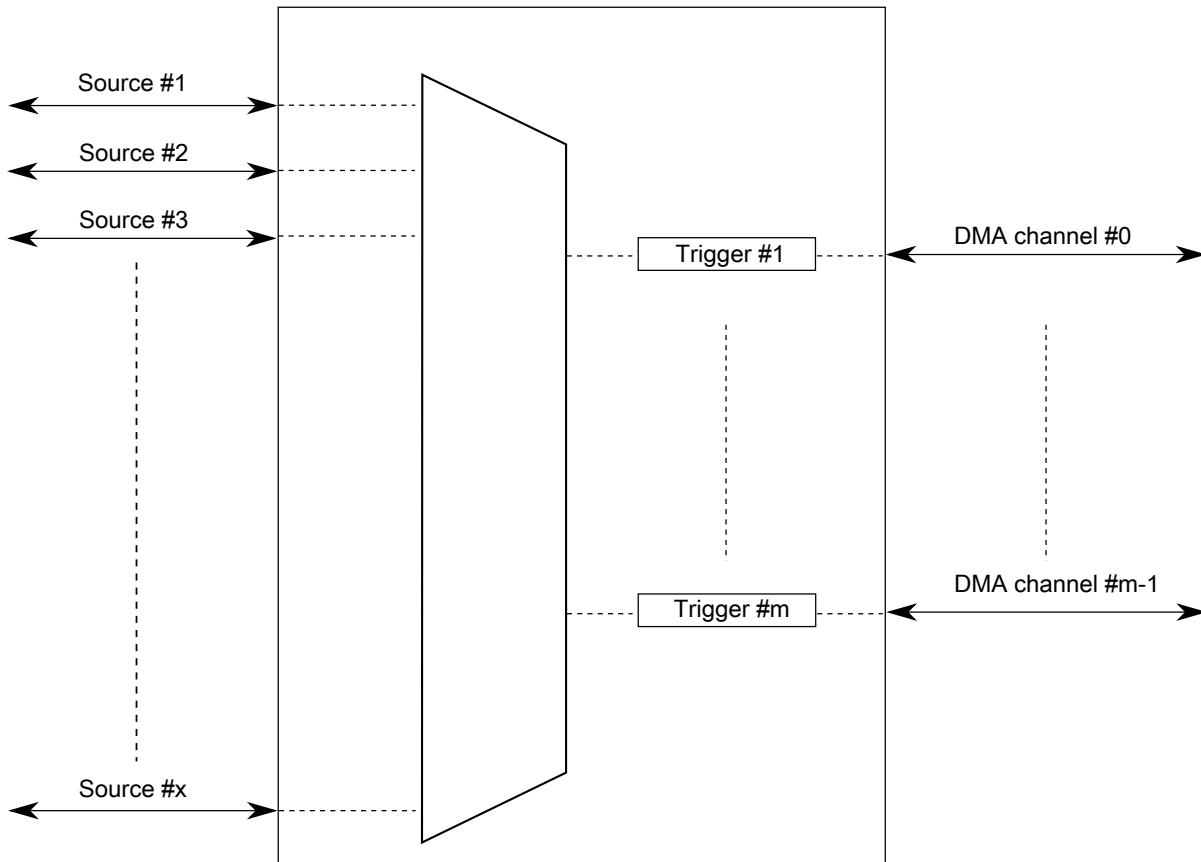

### 5.3.2 DMA channels with periodic triggering capability

Besides the normal routing functionality, the first 4 channels of the DMAMUX provide a special periodic triggering capability that can be used to provide an automatic mechanism to transmit bytes, frames, or packets at fixed intervals without the need for processor intervention.

The trigger is generated by the periodic interrupt timer (PIT); as such, the configuration of the periodic triggering interval is done via configuration registers in the PIT. See the section on periodic interrupt timer for more information on this topic.

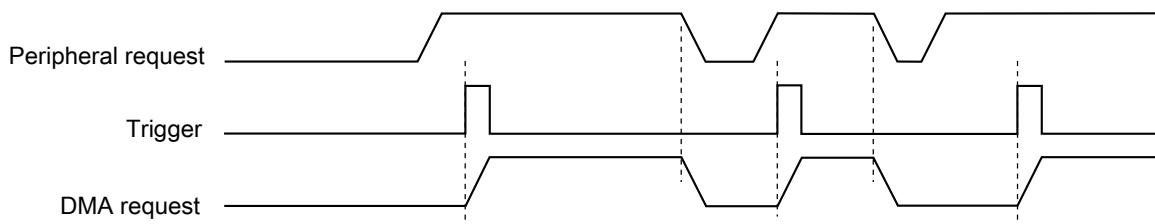

#### Note

Because of the dynamic nature of the system (due to DMA channel priorities, bus arbitration, interrupt service routine lengths, etc.), the number of clock cycles between a trigger and the actual DMA transfer cannot be guaranteed.

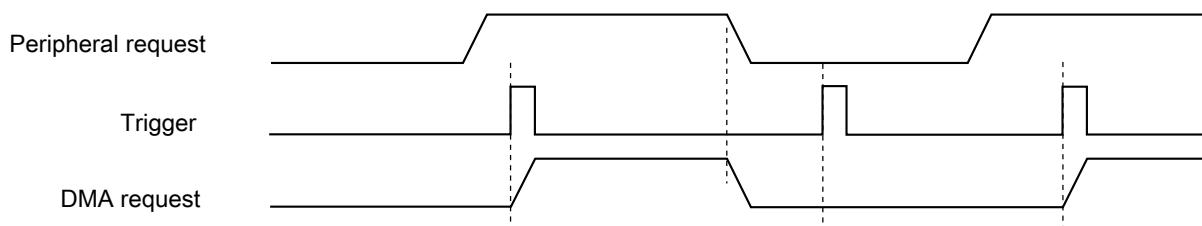

**Figure 5-2. DMAMUX triggered channels**

The DMA channel triggering capability allows the system to schedule regular DMA transfers, usually on the transmit side of certain peripherals, without the intervention of the processor. This trigger works by gating the request from the peripheral to the DMA until a trigger event has been seen. This is illustrated in the following figure.

**Figure 5-3. DMAMUX channel triggering: normal operation**

After the DMA request has been serviced, the peripheral will negate its request, effectively resetting the gating mechanism until the peripheral reasserts its request and the next trigger event is seen. This means that if a trigger is seen, but the peripheral is not requesting a transfer, then that trigger will be ignored. This situation is illustrated in the following figure.

**Figure 5-4. DMAMUX channel triggering: ignored trigger**

This triggering capability may be used with any peripheral that supports DMA transfers, and is most useful for two types of situations:

- Periodically polling external devices on a particular bus

As an example, the transmit side of an SPI is assigned to a DMA channel with a trigger, as described above. After it has been set up, the SPI will request DMA transfers, presumably from memory, as long as its transmit buffer is empty. By using a trigger on this channel, the SPI transfers can be automatically performed every 5  $\mu$ s (as an example). On the receive side of the SPI, the SPI and DMA can be configured to transfer receive data into memory, effectively implementing a method to periodically read data from external devices and transfer the results into memory without processor intervention.

- Using the GPIO ports to drive or sample waveforms

By configuring the DMA to transfer data to one or more GPIO ports, it is possible to create complex waveforms using tabular data stored in on-chip memory. Conversely, using the DMA to periodically transfer data from one or more GPIO ports, it is possible to sample complex waveforms and store the results in tabular form in on-chip memory.

A more detailed description of the capability of each trigger, including resolution, range of values, and so on, may be found in the periodic interrupt timer section.

### **5.3.3 Always-enabled DMA sources**

In addition to the peripherals that can be used as DMA sources, each DMA Channel can be individually configured to function as an Always Enabled source. Unlike the peripheral DMA sources, where the peripheral controls the flow of data during DMA transfers, the always enabled channel provide no such "throttling" of the data transfers. These sources are most useful in the following cases:

- Performing DMA transfers to/from GPIO—Moving data from/to one or more GPIO pins, either unthrottled (that is, as fast as possible), or periodically (using the DMA triggering capability).
- Performing DMA transfers from memory to memory—Moving data from memory to memory, typically as fast as possible, sometimes with software activation.
- Performing DMA transfers from memory to the external bus, or vice-versa—Similar to memory to memory transfers, this is typically done as quickly as possible.
- Any DMA transfer that requires software activation—Any DMA transfer that should be explicitly started by software.

In cases where software should initiate the start of a DMA transfer, an always-enabled DMA channel can be used to provide maximum flexibility. When activating a DMA channel via software, subsequent executions of the minor loop require that a new start event be sent. This can either be a new software activation, or a transfer request from the DMA channel MUX. The options for doing this are:

- Transfer all data in a single minor loop.

By configuring the DMA to transfer all of the data in a single minor loop (that is, major loop counter = 1), no reactivation of the channel is necessary. The disadvantage to this option is the reduced granularity in determining the load that the DMA transfer will impose on the system. For this option, the DMA channel must be disabled in the DMA channel MUX.

- Use explicit software reactivation.

In this option, the DMA is configured to transfer the data using both minor and major loops, but the processor is required to reactivate the channel by writing to the DMA registers *after every minor loop*. For this option, the DMA channel must be disabled in the DMA channel MUX.

- Use an always-enabled DMA source.

In this option, the DMA is configured to transfer the data using both minor and major loops, and the DMA channel MUX does the channel reactivation. For this option, the DMA channel should be enabled and configured as "always enabled" channel. Note that the reactivation of the channel can be continuous (DMA triggering is disabled) or can use the DMA triggering capability. In this manner, it is possible to execute periodic transfers of packets of data from one source to another, without processor intervention.

#### **NOTE**

When a channel is configured as "Always Enabled", then the peripheral DMA sources for that channel are ignored; i.e. SOURCE field has no effect.

### **5.3.4 Clocks**

The following table describes the clock sources for DMAMUX. See the clocking chapter of your device to know the clock setting, configuration and gating information.

**Table 5-2. DMAMUX clocks**

Clock name	Description
ipg_clk	Peripheral clock
ipg_clk_s	Peripheral access clock

### 5.3.5 Reset

The reset state of each individual bit is shown in [Memory map/register definition](#). In summary, after reset, all channels are disabled and must be explicitly enabled before use.

## 5.4 External signals

The DMAMUX has no external pins.

## 5.5 Initialization/application information

This section provides instructions for initializing the DMA channel MUX.

### 5.5.1 Enabling and configuring sources

To enable a source with periodic triggering:

1. Determine with which DMA channel the source will be associated. Note that only the first 4 DMA channels have periodic triggering capability.
2. Clear the CHCFG[ENBL] and CHCFG[TRIG] fields of the DMA channel.
3. Ensure that the DMA channel is properly configured in the DMA. The DMA channel may be enabled at this point.
4. Configure the corresponding timer.
5. Select the source to be routed to the DMA channel. Write to the corresponding CHCFG register, ensuring that the CHCFG[ENBL] and CHCFG[TRIG] fields are set.

#### NOTE

The following is an example. See the chip configuration details for the number of this device's DMA channels that have triggering capability.

To configure source #5 transmit for use with DMA channel 1, with periodic triggering capability:

1. Write 0x00000000 to CHCFG1.
2. Configure channel 1 in the DMA, including enabling the channel.
3. Configure a timer for the desired trigger interval.
4. Write 0xC0000005 to CHCFG1.

The following code example illustrates steps 1 and 4 above:

```

void DMAMUX_Init(uint8_t DMA_CH, uint8_t DMAMUX_SOURCE)
{
    DMAMUX_0.CHCFG[DMA_CH].B.SOURCE = DMAMUX_SOURCE;
    DMAMUX_0.CHCFG[DMA_CH].B.ENBL   = 1;
    DMAMUX_0.CHCFG[DMA_CH].B.TRIG   = 1;
}

```

To enable a source without periodic triggering:

1. Determine with which DMA channel the source will be associated. Note that only the first 4 DMA channels have periodic triggering capability.
2. Clear the CHCFG[ENBL] and CHCFG[TRIG] fields of the DMA channel.
3. Ensure that the DMA channel is properly configured in the DMA. The DMA channel may be enabled at this point.
4. Select the source to be routed to the DMA channel. Write to the corresponding CHCFG register, ensuring that CHCFG[ENBL] is set while CHCFG[TRIG] is cleared.

### NOTE

The following is an example. See the chip configuration details for the number of this device's DMA channels that have triggering capability.

To configure source #5 transmit for use with DMA channel 1 with no periodic triggering capability :

1. Write 0x00000000 to CHCFG1.
2. Configure channel 1 in the DMA, including enabling the channel.
3. Write 0x80000005 to CHCFG1.

The following code example illustrates steps 1 and 3 above:

```

In File registers.h:
#define DMAMUX_BASE_ADDR      0x40021000/* Example only ! */
/* Following example assumes long is 32-bits */
volatile unsigned long *CHCFG0 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0000);
volatile unsigned long *CHCFG1 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0004);
volatile unsigned long *CHCFG2 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0008);
volatile unsigned long *CHCFG3 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x000C);
volatile unsigned long *CHCFG4 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0010);
volatile unsigned long *CHCFG5 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0014);
volatile unsigned long *CHCFG6 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0018);
volatile unsigned long *CHCFG7 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x001C);
volatile unsigned long *CHCFG8 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0020);
volatile unsigned long *CHCFG9 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0024);
volatile unsigned long *CHCFG10= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0028);
volatile unsigned long *CHCFG11= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x002C);
volatile unsigned long *CHCFG12= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0030);
volatile unsigned long *CHCFG13= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0034);
volatile unsigned long *CHCFG14= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0038);
volatile unsigned long *CHCFG15= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x003C);

In File main.c:
#include "registers.h"
:
:
*CHCFG1 = 0x00000000;
*CHCFG1 = 0x80000005;

```

**To disable a source:**

A particular DMA source may be disabled by not writing the corresponding source value into any of the CHCFG registers. Additionally, some module-specific configuration may be necessary. See the appropriate section for more details.

**To switch the source of a DMA channel:**

1. Disable the DMA channel in the DMA and reconfigure the channel for the new source.
2. Clear the CHCFG[ENBL] and CHCFG[TRIG] bits of the DMA channel.
3. Select the source to be routed to the DMA channel. Write to the corresponding CHCFG register, ensuring that the CHCFG[ENBL] and CHCFG[TRIG] fields are set.

To switch DMA channel 8 from source #5 transmit to source #7 transmit:

1. In the DMA configuration registers, disable DMA channel 8 and reconfigure it to handle the transfers to peripheral slot 7. This example assumes channel 8 doesn't have triggering capability.
2. Write 0x00000000 to CHCFG8.
3. Write 0x80000007 to CHCFG8. (In this example, setting CHCFG[TRIG] would have no effect due to the assumption that channel 8 does not support the periodic triggering functionality.)

The following code example illustrates steps 2 and 3 above:

```
In File registers.h:
#define DMAMUX_BASE_ADDR      0x40021000/* Example only ! */
/* Following example assumes long is 32-bits */
volatile unsigned long *CHCFG0 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0000);
volatile unsigned long *CHCFG1 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0004);
volatile unsigned long *CHCFG2 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0008);
volatile unsigned long *CHCFG3 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x000C);
volatile unsigned long *CHCFG4 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0010);
volatile unsigned long *CHCFG5 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0014);
volatile unsigned long *CHCFG6 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0018);
volatile unsigned long *CHCFG7 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x001C);
volatile unsigned long *CHCFG8 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0020);
volatile unsigned long *CHCFG9 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0024);
volatile unsigned long *CHCFG10= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0028);
volatile unsigned long *CHCFG11= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x002C);
volatile unsigned long *CHCFG12= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0030);
volatile unsigned long *CHCFG13= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0034);
volatile unsigned long *CHCFG14= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0038);
volatile unsigned long *CHCFG15= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x003C);

In File main.c:
#include "registers.h"
:
:
*CHCFG8 = 0x00000000;
*CHCFG8 = 0x80000007;
```

### 5.5.1.1 Configuration options

Table 5-3. Channel Configuration Options

ENBL	TRIG	A_ON	Function	Mode
0	X	X	DMA channel is disabled	Disabled Mode
1	0	0	DMA channel is enabled with no triggering (transparent)	Normal Mode
1	1	0	DMA channel is enabled with triggering	Periodic Trigger Mode
1	0	1	DMA channel is always enabled	Always On Mode
1	1	1	DMA channel is always enabled with triggering	Always On Trigger Mode

## 5.6 Memory map/register definition

This section provides a detailed description of all memory-mapped registers in the DMAMUX.

### 5.6.1 DMAMUX register descriptions

#### 5.6.1.1 DMAMUX memory map

DMAMUX base address: 400E\_C000h

Offset	Register	Width (in bits)	Access	Reset value
0h - 7Ch	Channel a Configuration Register (CHCFG0 - CHCFG31)	32	RW	0000_0000h

#### 5.6.1.2 Channel a Configuration Register (CHCFG0 - CHCFG31)

##### 5.6.1.2.1 Offset

For a = 0 to 31:

Register	Offset
CHCFGa	0h + (a × 4h)

### 5.6.1.2.2 Function

Each of the DMA channels can be independently enabled/disabled and associated with one of the DMA slots (peripheral slots or always-on slots) in the system.

#### NOTE

Setting multiple CHCFG registers with the same source value will result in unpredictable behavior. This is true, even if a channel is disabled (ENBL==0).

Before changing the trigger or source settings, a DMA channel must be disabled via CHCFGn[ENBL].

### 5.6.1.2.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 5.6.1.2.4 Fields

Field	Function
31 ENBL	DMA Mux Channel Enable  Enables the channel for DMA Mux. The DMA has separate channel enables/disables, which should be used to disable or reconfigure a DMA channel. 0b - DMA Mux channel is disabled 1b - DMA Mux channel is enabled
30 TRIG	DMA Channel Trigger Enable  Enables the periodic trigger capability for the triggered DMA channel. 0b - Triggering is disabled. If triggering is disabled and ENBL is set, the DMA Channel will simply route the specified source to the DMA channel. (Normal mode) 1b - Triggering is enabled. If triggering is enabled and ENBL is set, the DMA_CH_MUX is in Periodic Trigger mode.
29 A_ON	DMA Channel Always Enable

Table continues on the next page...

Field	Function
	Enables the DMA Channel to be always ON. If TRIG bit is set, the module will assert request on every trigger. 0b - DMA Channel Always ON function is disabled 1b - DMA Channel Always ON function is enabled
28-7 —	Reserved field
6-0 SOURCE	DMA Channel Source (Slot Number) Specifies which DMA source, if any, is routed to a particular DMA channel. See the chip-specific DMA_CH_MUX information for details about the peripherals and their slot numbers.

### 6.2 Overview

The enhanced direct memory access (eDMA) controller is a second-generation module capable of performing complex data transfers with minimal intervention from a host processor. The hardware microarchitecture includes:

- A DMA engine that performs:
  - Source address and destination address calculations
  - Data-movement operations
- Local memory containing transfer control descriptors for each of the 32 channels

## 6.2.1 Block diagram

The following figure illustrates the components of the eDMA system, including the eDMA module ("engine").

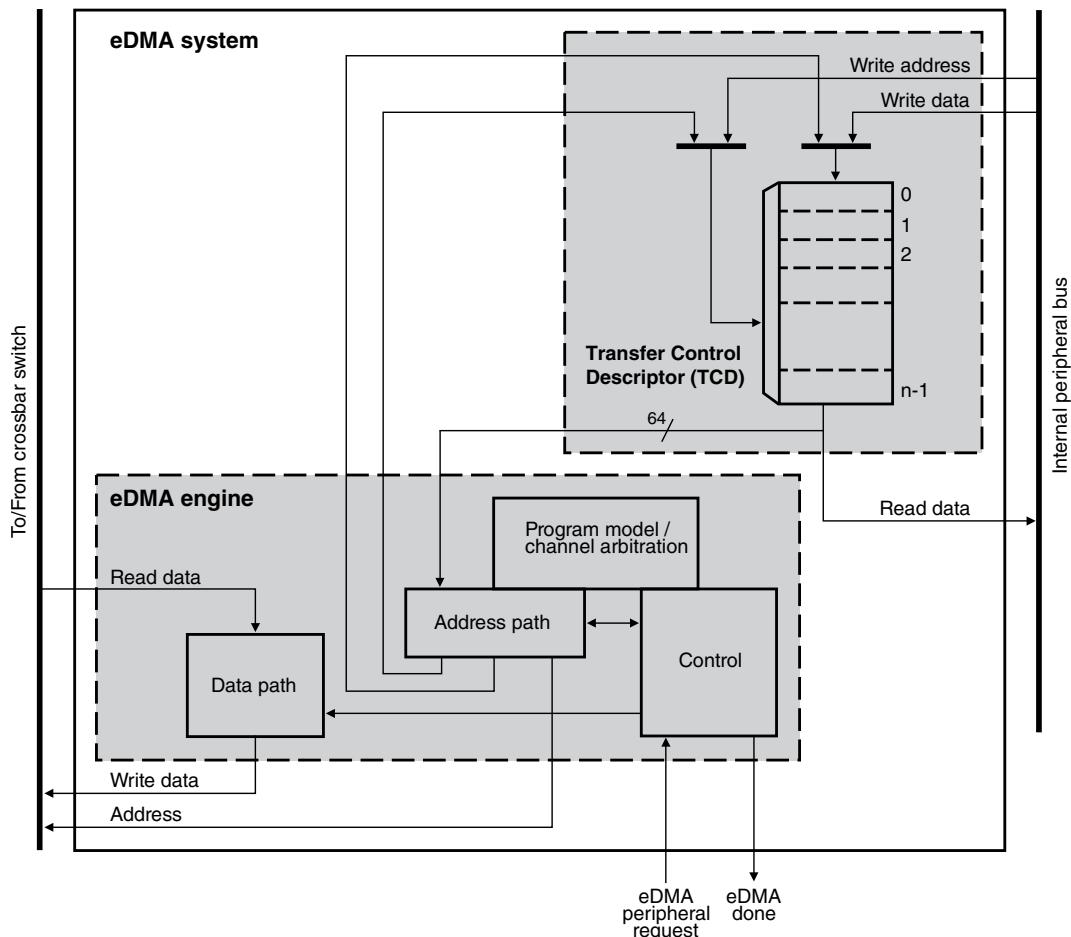

Figure 6-1. Block diagram

## 6.2.2 Block parts

The eDMA module comprises two major modules: the eDMA engine and the transfer-control descriptor local memory.

Table 6-2 describes the eDMA engine submodules.

Table 6-2. eDMA engine submodules

Submodule	Function
Address path	<p>The address path block:</p> <ul style="list-style-type: none"> <li>Provides registered versions of two channel Transfer Control Descriptors (TCDs)—channel x (normal start) and channel y (preemption start)</li> <li>Manages all master bus-address calculations</li> </ul>

*Table continues on the next page...*

**Table 6-2. eDMA engine submodules (continued)**

Submodule	Function
	<p>All channels provide the same functionality. This structure enables preemption of data transfers associated with an active channel (after completion of a read/write sequence) if the eDMA engine asserts a higher priority channel activation.</p> <p>After eDMA activates a channel, it runs until the minor loop completes, unless preempted by a higher priority channel. This provides a mechanism (enabled by <a href="#">DCHPRIn[ECP]</a>) in which the eDMA engine can preempt a large data move operation to minimize the time another channel stalls.</p> <p>When the eDMA engine selects a channel to execute, it reads the contents of the channel TCD from local memory and loads it into one of the following:</p> <ul style="list-style-type: none"> <li>• The address path channel x registers (normal start)</li> <li>• The address path channel y registers (preemption start)</li> </ul> <p>After the minor loop execution completes, the address path hardware writes the new values for the TCDn_{SADDR, DADDR, CITER} back to local memory. If the major iteration count completes, the eDMA engine performs additional processing, including:</p> <ul style="list-style-type: none"> <li>• Final address pointer updates</li> <li>• Reloading the TCDn_CITER field</li> <li>• A possible fetch of the next TCDn from memory as part of a scatter/gather operation.</li> </ul>
Data path	<p>The data path block implements the bus master read/write data path. It includes a data buffer and the necessary multiplex logic to support any required data alignment. The internal read data bus is the primary input, and the internal write data bus is the primary output.</p> <p>The address and data path modules directly support the two-stage pipelined internal bus. The address path module represents the first stage of the bus pipeline (address phase). The data path module implements the second stage of the pipeline (data phase).</p>
Programming model/channel arbitration	<p>This block implements:</p> <ul style="list-style-type: none"> <li>• The first section of the eDMA programming model</li> <li>• Channel arbitration logic</li> </ul> <p>The programming model registers connect to the chip's internal peripheral bus. The eDMA peripheral request inputs and interrupt request outputs also connect to this block (via control logic).</p>
Control	<p>The control block provides all control functions for the eDMA engine. For data transfers in which the source size (SSIZE) and destination size (DSIZE) are equal, the eDMA engine performs a series of source read/destination write operations until it has transferred the number of bytes specified in the minor loop byte count (NBYTES). For TCDs in which the source and destination sizes are not equal, the eDMA engine executes multiple accesses of the smaller size data for each reference of the larger size. For example, if the source size (SSIZE) references 16-bit data and the destination size (DSIZE) is 32-bit data, eDMA performs two reads, then one 32-bit write.</p>

[Table 6-3](#) explains the partitioning of the TCD local memory.

**Table 6-3. Transfer control descriptor memory**

Submodule	Description
Memory controller	The Memory controller logic implements the required dual-ported controller, managing accesses from the eDMA engine as well as references from the internal peripheral bus. If simultaneous accesses occur, the eDMA engine receives priority and the peripheral transaction stalls.
Memory array	The Memory array provides TCD storage for the transfer profile for each channel.

### 6.2.3 Features

The eDMA module is a highly programmable data-transfer engine optimized to minimize any required intervention from the host processor. Use it for applications where you statically know the size of the data to be transferred and do not define the size within the transferred data itself. The eDMA module features:

- All data movement via dual-address transfers: read from source, write to destination
  - Programmable source and destination addresses and transfer size
  - Support for enhanced addressing modes
- 32-channel implementation performs complex data transfers with minimal intervention from a host processor
  - Internal data buffer, used as temporary storage to support 16- and 32-byte transfers
  - Connections to the crossbar switch (AXBS) for bus mastering the data movement
- TCD supports two-deep, nested transfer operations
  - 32-byte TCD stored in local memory for each channel
  - An inner data transfer loop defined by a minor byte transfer count
  - An outer data transfer loop defined by a major iteration count
- Channel activation via one of three methods:
  - Explicit software initiation
  - Initiation via a channel-to-channel linking mechanism for continuous transfers
  - Peripheral-paced hardware requests, one per channel
- Fixed-priority and round-robin channel arbitration
- Channel completion notification via programmable interrupt requests
  - One interrupt per channel. eDMA engine can generate an interrupt when major iteration count completes
  - Programmable error terminations per channel and logically summed together to form one error interrupt to the interrupt controller

- Programmable support for scatter/gather DMA processing
- Support for complex data structures

### NOTE

In the discussion of this module,  $n$  is the channel number.

## 6.3 Functional description

The operation of the eDMA is described in the following subsections.

### 6.3.1 Modes of operation

eDMA operates in the following modes:

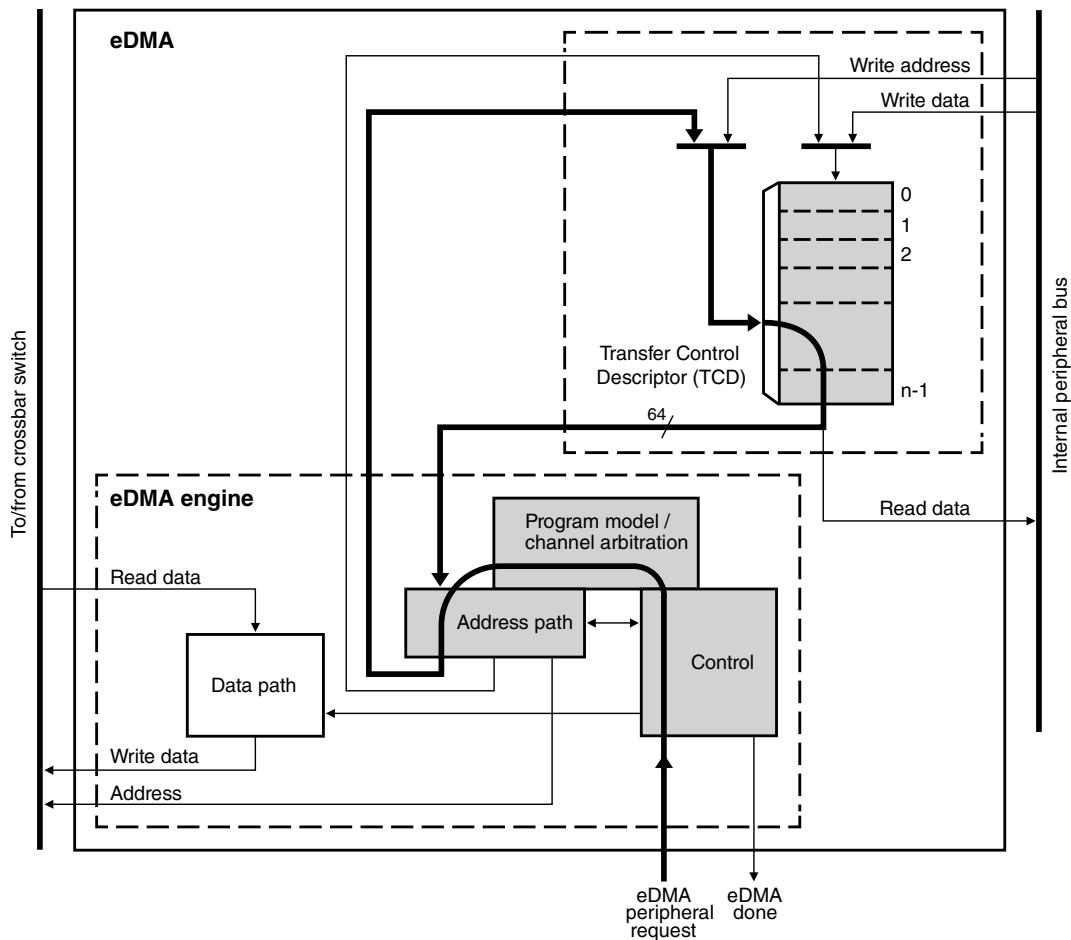

**Table 6-4. Modes of operation**

Mode	Description
Normal	<p>In Normal mode, eDMA transfers data from a source to a destination. The source and destination can be a memory block or an I/O block capable of operation with eDMA.</p> <p>A service request initiates a transfer of a specific number of bytes (NBYTES) as specified in the TCD.</p> <ul style="list-style-type: none"> <li>• The <i>minor loop</i> is the sequence of read and write operations that transfers the NBYTES of data for a service request.</li> <li>• Each service request executes one iteration of the major loop, transferring NBYTES of data.</li> </ul>
Debug	<p>DMA operation is configurable in Debug mode via <a href="#">Control (CR)</a></p> <ul style="list-style-type: none"> <li>• If CR[EDBG] = 0, eDMA continues to operate normally when the chip is in debug mode.</li> <li>• If CR[EDBG] = 1, eDMA stops transferring data when the chip enters debug mode. If a channel is active when eDMA enters Debug mode, eDMA continues operation until the channel retires.</li> </ul>
Wait	<p>Before entering Wait mode, eDMA attempts to complete any transfer that is in progress. After the transfer completes, the chip enters Wait mode.</p>

### 6.3.2 eDMA basic data flow

The basic flow of a data transfer can be partitioned into three segments.

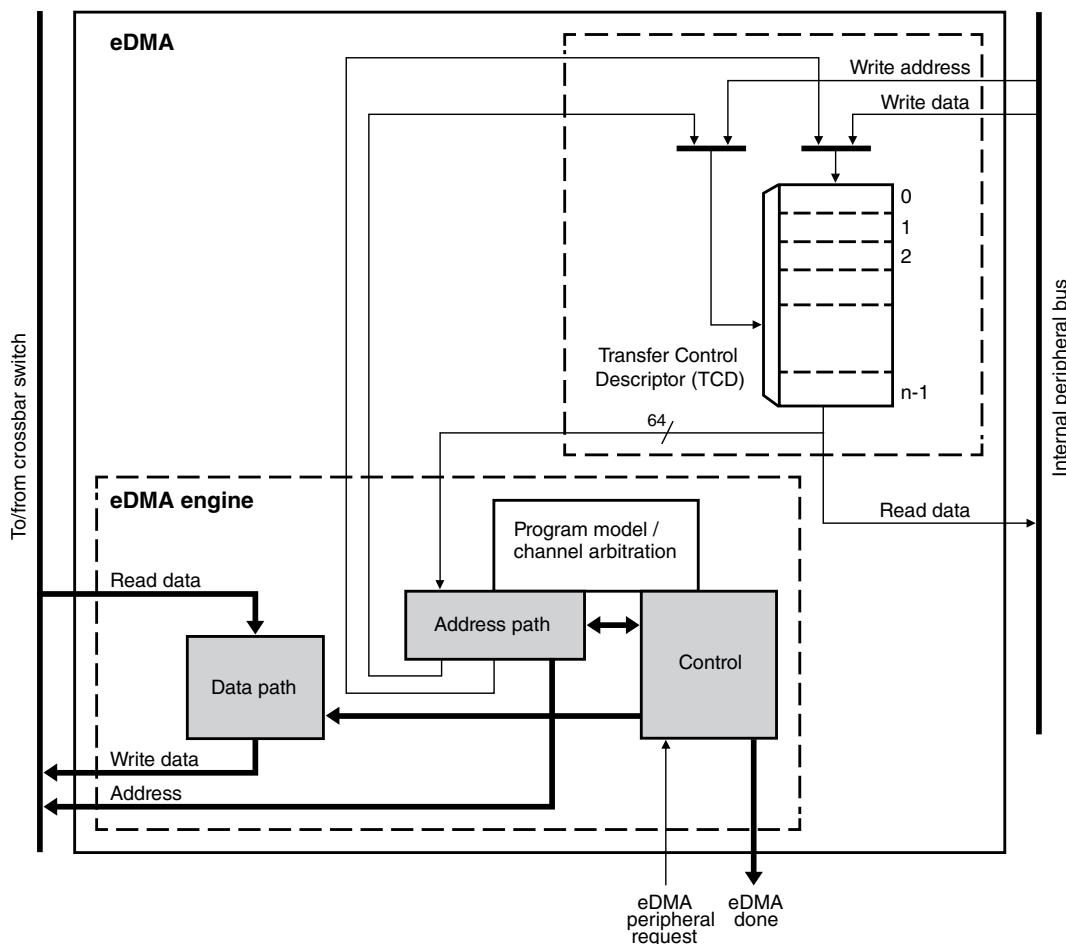

As shown in the following diagram, the first segment involves the channel activation:

**Figure 6-2. eDMA operation, part 1**

This example uses the assertion of the eDMA peripheral request signal to request service for channel  $n$ . Channel activation via software and the  $\text{TCD}_n\text{-CSR}[\text{START}]$  bit follows the same basic flow as peripheral requests. The eDMA request input signal is registered internally and then routed through the eDMA engine: first through the control module, then into the program model and channel arbitration. In the next cycle, the channel arbitration executes, using either the fixed-priority or round-robin algorithm. After arbitration is complete, the activated channel number is sent through the address path and converted into the required address to access the local memory for  $\text{TCD}_n$ . Next, the TCD memory is accessed and the required descriptor read from the local memory and loaded into the eDMA engine's internal register file. The TCD memory is 64 bits wide to minimize the time needed to fetch the activated channel descriptor and load it into the internal register file.

The following diagram illustrates the second part of the basic data flow:

**Figure 6-3. eDMA operation, part 2**

The modules associated with the data transfer (address path, data path, and control) execute sequentially through the required source reads and destination writes to perform the data movement. The source reads are initiated and the fetched data is temporarily stored in the data path block until it is gated onto the internal bus during the destination write. This source read/destination write processing continues until the minor byte count has transferred.

After the minor byte count has moved, the final phase of the basic data flow is performed. In this segment, the address path logic performs the required updates to certain fields in the appropriate TCD, for example, SADDR, DADDR, CITER. If the major iteration count is exhausted, additional operations are performed. These include the final address adjustments and reloading of the BITER field into the CITER. Assertion of an optional interrupt request also occurs at this time, as does a possible fetch of a new TCD from memory using the scatter/gather address pointer included in the descriptor (if scatter/gather is enabled). The updates to the TCD memory and the assertion of an interrupt request are shown in the following diagram.

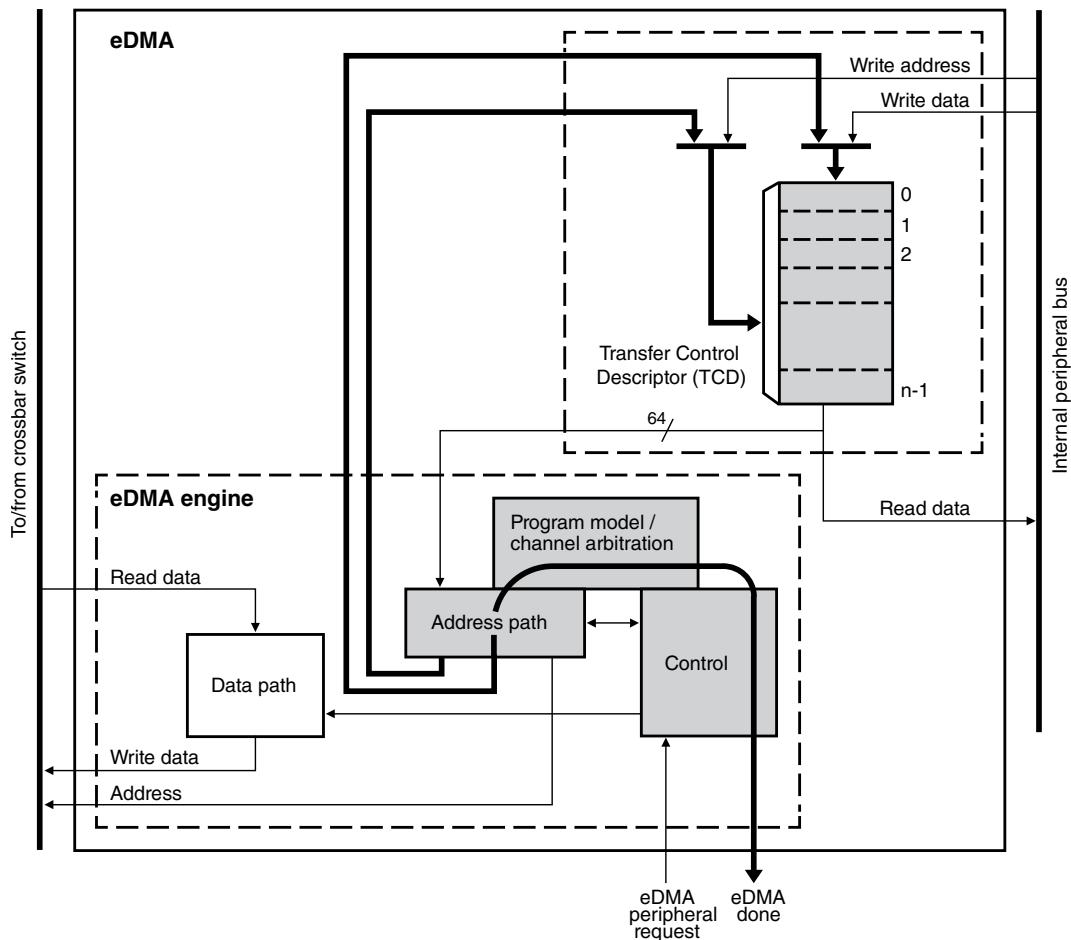

Figure 6-4. eDMA operation, part 3

### 6.3.3 Fault reporting and handling

Channel errors are reported in the Error Status register (DMAx\_ES) and can be caused by:

- A configuration error, which is an illegal setting in the transfer-control descriptor or an illegal priority register setting in Fixed-Arbitration mode, or
- An error termination to a bus master read or write cycle

A configuration error is reported when the starting source or destination address, source or destination offsets, minor loop byte count, or the transfer size represent an inconsistent state. Each of these possible causes is detailed below:

- The addresses and offsets must be aligned on 0-modulo transfer size boundaries.
- The minor loop byte count must be a multiple of the source and destination transfer sizes.

- All source reads and destination writes must be configured to the natural boundary of the programmed transfer size respectively.
- In fixed arbitration mode, a configuration error is caused by any two channel priorities being equal. All channel priority levels must be unique when fixed arbitration mode is enabled.

### **NOTE**

When two channels have the same priority, a channel priority error exists and is reported in the Error Status register. However, the channel number is not reported in the Error Status register. When all of the channel priorities within a group are not unique, the channel number selected by arbitration is undetermined.

To aid in Channel Priority Error (CPE) debug, set the Halt On Error bit in the DMA's Control register. If all channel priorities within a group are not unique, the DMA is halted after the CPE error is recorded. The DMA remains halted and does not process any channel service requests. After all of the channel priorities are set to unique numbers, the DMA may be enabled again by clearing the HALT bit.

- If a scatter/gather operation is enabled upon channel completion, a configuration error is reported if the scatter/gather address (DLAST\_SGA) is not aligned on a 32-byte boundary.
- If minor loop channel linking is enabled upon channel completion, a configuration error is reported when the link is attempted if the TCDn\_CITER[ELINK] bit does not equal the TCDn\_BITER[ELINK] bit.

If enabled, all configuration error conditions, except the scatter/gather and minor-loop link errors, report as the channel activates and asserts an error interrupt request. A scatter/gather configuration error is reported when the scatter/gather operation begins at major loop completion, when properly enabled. A minor loop channel link configuration error is reported when the link operation is serviced at minor loop completion.

If a system bus read or write is terminated with an error, the data transfer is stopped and the appropriate bus error flag set. In this case, the state of the channel's transfer control descriptor is updated by the eDMA engine with the current source address, destination address, and current iteration count at the point of the fault. When a system bus error occurs, the channel terminates after the next transfer. Due to pipeline effect, the next transfer is already in progress when the bus error is received by the eDMA. If a bus error occurs on the last read prior to beginning the write sequence, the write executes using the

data captured during the bus error. If a bus error occurs on the last write prior to switching to the next read sequence, the read sequence executes before the channel terminates due to the destination bus error.

A transfer may be canceled by software with the CR[CX] bit. When a cancel transfer request is recognized, the DMA engine stops processing the channel. The current read-write sequence is allowed to finish. If the cancel occurs on the last read-write sequence of a major or minor loop, the cancel request is discarded and the channel retires normally.

The error cancel transfer is the same as a cancel transfer except the Error Status register (DMAx\_ES) is updated with the canceled channel number and ECX is set. The TCD of a canceled channel contains the source and destination addresses of the last transfer saved in the TCD. If the channel needs to be restarted, you must re-initialize the TCD because the aforementioned fields no longer represent the original parameters. When a transfer is canceled by the error cancel transfer mechanism, the channel number is loaded into DMA\_ES[ERRCHN] and ECX and VLD are set. In addition, an error interrupt may be generated if enabled.

### **NOTE**

The cancel transfer request enables you to stop a large data transfer when the full data transfer is no longer needed. The cancel transfer bit does not abort the channel. It simply stops the transferring of data and then retires the channel through its normal shutdown sequence. The application software must manage the context of the cancel. If an interrupt is desired (or not), then the interrupt should be enabled (or disabled) before the cancel request. The application software must clean up the transfer control descriptor because the full transfer did not occur.

The occurrence of any error causes the eDMA engine to stop normal processing of the active channel immediately (it goes to its error processing states and the transaction to the system bus still has pipeline effect), and the appropriate channel bit in the eDMA error register is asserted. At the same time, the details of the error condition are loaded into the Error Status register (DMAx\_ES). The major loop complete indicators, setting the transfer control descriptor DONE flag and the possible assertion of an interrupt request, are not affected when an error is detected. After the error status has been updated, the eDMA engine continues operating by servicing the next appropriate channel. A channel that experiences an error condition is not automatically disabled. If a channel is terminated by an error and then issues another service request before the error is fixed, that channel executes and terminates with the same error condition.

### 6.3.4 Channel preemption

Channel preemption is enabled on a per-channel basis by setting DCHPRIn[ECP]. Channel preemption enables the executing channel's data transfers to temporarily be suspended in favor of starting a higher priority channel. After the preempting channel has completed its minor loop data transfers, the preempted channel is restored and resumes execution. After the restored channel completes one read/write sequence, it is again eligible for preemption. If any higher priority channel is requesting service, the restored channel is suspended and the higher priority channel is serviced. Nested preemption, that is, attempting to preempt a preempting channel, is not supported. After a preempting channel begins execution, it cannot be preempted. Preemption is available only when fixed arbitration is selected.

A channel's ability to preempt another channel can be disabled by setting DCHPRIn[DPA]. When a channel's preemption ability is disabled, that channel cannot suspend a lower priority channel's data transfer, regardless of the lower priority channel's ECP setting. This enables a pool of low priority, large data-moving channels to be defined. These low priority channels can be configured to not preempt each other, thus preventing a low priority channel from consuming the preempt slot normally available to a true, high priority channel.

### 6.3.5 Clocks

The following table describes the clock sources for eDMA. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

**Table 6-5. eDMA clocks**

Clock name	Description
edma_hclk	Module clock
ipg_clk	Peripheral clock

## 6.4 Initialization/application information

The following sections discuss initialization of the eDMA and programming considerations.

## 6.4.1 eDMA initialization

To initialize the eDMA:

1. Write to the CR if a configuration other than the default is desired.
2. Write the channel priority levels to the DCHPRI $n$  registers if a configuration other than the default is desired.
3. Enable error interrupts in the EEI register if desired.
4. Write the 32-byte TCD for each channel that may request service.
5. Enable any hardware service requests via the ERQ register.
6. Request channel service via either:
  - Software: setting TCD $n$ \_CSR[START]
  - Hardware: slave device asserting its eDMA peripheral request signal

After any channel requests service, a channel is selected for execution based on the arbitration and priority levels in the programming model. The eDMA engine reads the entire TCD, including the TCD control and status fields, as shown in [Table 6-6](#), for the selected channel into its internal address path module.

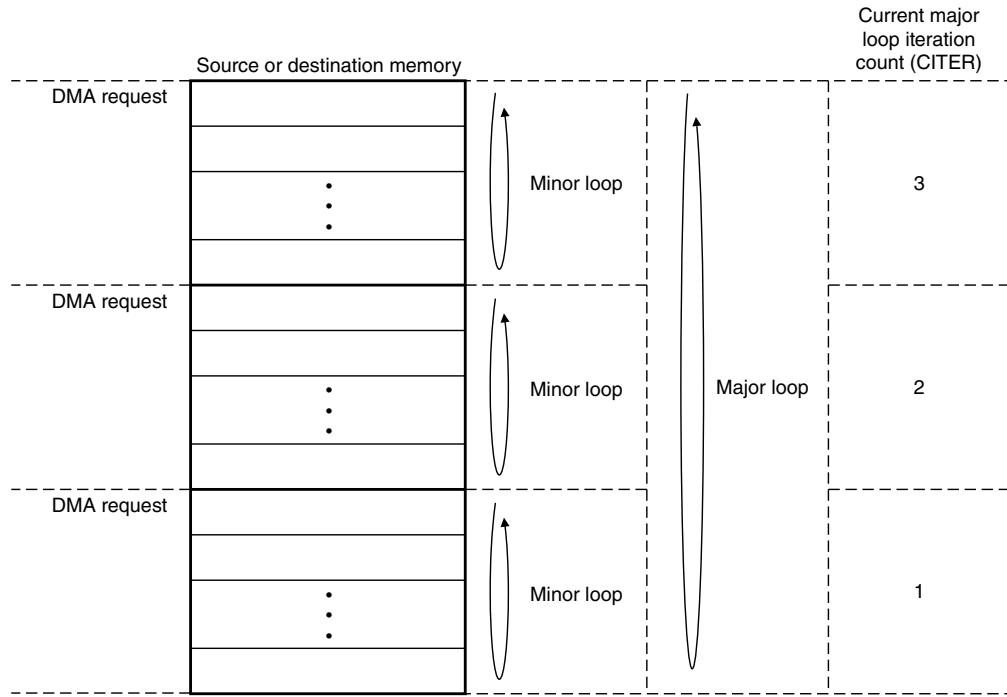

As the TCD is read, the first transfer is initiated on the system bus, unless a configuration error is detected. Transfers from the source, as defined by TCD $n$ \_SADDR, to the destination, as defined by TCD $n$ \_DADDR, continue until the number of bytes specified by TCD $n$ \_NBUTES have been transferred.

When the transfer is complete, the eDMA engine's local TCD $n$ \_SADDR, TCD $n$ \_DADDR, and TCD $n$ \_CITER are written back to the main TCD memory and any minor loop channel linking is performed, if enabled. If the major loop is exhausted, further post-processing executes, such as interrupts, major loop channel linking, and scatter/gather operations, if enabled.

**Table 6-6. TCD control and status fields**

TCD $n$ _CSR field name	Description
START	Control bit to start channel explicitly when using a software-initiated DMA service (automatically cleared by hardware)
ACTIVE	Status bit indicating the channel is currently in execution
DONE	Status bit indicating major loop completion (cleared by software when using a software-initiated DMA service)
DREQ	Control bit to disable DMA request at end of major loop completion when using a hardware-initiated DMA service
BWC	Control bits for throttling bandwidth control of a channel
ESG	Control bit to enable scatter/gather feature
INTHALF	Control bit to enable interrupt when major loop is half complete
INTMAJOR	Control bit to enable interrupt when major loop completes

The following figure shows how each DMA request initiates one minor-loop transfer, or iteration, without CPU intervention. DMA arbitration can occur after each minor loop, and one level of minor loop DMA preemption is allowed. The number of minor loops in a major loop is specified by the beginning iteration count (BITER).

**Figure 6-5. Example of multiple loop iterations**

The following figure lists the memory array terms and how the TCD settings interrelate.

xADDR: (Starting address)	xSIZE: (size of one data transfer)	Minor loop (NBYTES in minor loop, often the same value as xSIZE)	Offset (xOFF): number of bytes added to current address after each transfer (often the same value as xSIZE)
		⋮	
		⋮	
		⋮

## 6.4.2 Programming errors

The eDMA performs various tests on the transfer control descriptor to verify consistency in the descriptor data. Most programming errors are reported on a per-channel basis with the exception of channel priority error (ES[CPE]).

For all error types other than group or channel priority errors, the channel number causing the error is recorded in the Error Status register (DMAx\_ES). If the error source is not removed before the next activation of the problem channel, the error is detected and recorded again.

Channel priority errors are identified within a group after that group has been selected as the active group. For example:

1. The eDMA is configured for fixed group and fixed channel arbitration modes.
2. Group 1 is the highest priority and all channels are unique in that group.
3. Group 0 is the next highest priority and has two channels with the same priority level.
4. If Group 1 has any service requests, those requests will be executed.
5. After all of Group 1 requests have completed, Group 0 will be the next active group.
6. If Group 0 has a service request, then an undefined channel in Group 0 will be selected and a channel priority error will occur.
7. This repeats until the all of Group 0 requests have been removed or a higher priority Group 1 request comes in.

In this sequence, for item 2, the eDMA acknowledge lines will assert only if the selected channel is requesting service via the eDMA peripheral request signal. If interrupts are enabled for all channels, the user will get an error interrupt, but the channel number for the ERR register and the error interrupt request line may be wrong because they reflect the selected channel. A group priority error is global and any request in any group will cause a group priority error.

If priority levels are not unique, when any channel requests service, a channel priority error is reported. The highest channel/group priority with an active request is selected, but the lowest numbered channel with that priority is selected by arbitration and executed by the eDMA engine. The hardware service request handshake signals, error interrupts, and error reporting are associated with the selected channel.

## 6.4.3 Arbitration mode considerations

This section discusses arbitration considerations for the eDMA.

### 6.4.3.1 Fixed group arbitration, Fixed channel arbitration

In this mode, the channel service request from the highest priority channel in the highest priority group is selected to execute. If the eDMA is programmed so that the channels within one group use "fixed" priorities, and that group is assigned the highest "fixed" priority of all groups, that group can take all the bandwidth of the eDMA controller. That is, no other groups will be serviced if there is always at least one DMA request pending on a channel in the highest priority group when the controller arbitrates the next DMA request. The advantage of this scenario is that latency can be small for channels that need to be serviced quickly. Preemption is available in this scenario only.

### 6.4.3.2 Fixed group arbitration, Round-robin channel arbitration

The highest priority group with a request will be serviced. Lower priority groups will be serviced if no pending requests exist in the higher priority groups.

Within each group,  $c$  channels are serviced starting with the highest channel number and rotating through to the lowest channel number without regard to the channel priority levels assigned within the group.

This scenario could cause the same bandwidth consumption problem as indicated in [Fixed group arbitration, Fixed channel arbitration](#), but all the channels in the highest priority group will be serviced. Service latency will be short on the highest priority group, but could potentially be very much longer as the group priority decreases.

## 6.4.4 DMA transfer examples

This section presents examples of how to perform DMA transfers with the eDMA.

### 6.4.4.1 Single request

To perform a simple transfer of  $n$  bytes of data with one activation, set the major loop to one ( $TCDn\_CITER = TCDn\_BITER = 1$ ). The data transfer begins after the channel service request is acknowledged and the channel is selected to execute. After the transfer is complete,  $TCDn\_CSR[DONE]$  is set and an interrupt generates if properly enabled.

For example, the following TCD entry is configured to transfer 16 bytes of data. The eDMA is programmed for one iteration of the major loop transferring 16 bytes per iteration. The source memory has an 8-bit memory port located at 0x1000. The

destination memory has a 32-bit port located at 0x2000. The address offsets are programmed in increments to match the transfer size: one byte for the source and four bytes for the destination. The final source and destination addresses are adjusted to return to their beginning values.

```
TCDn_CITER = TCDn_BITER = 1
TCDn_NBYTES = 16
TCDn_SADDR = 0x1000
TCDn_SOFF = 1
TCDn_ATTR[SSIZE] = 0
TCDn_SLAST = -16
TCDn_DADDR = 0x2000
TCDn_DOFF = 4
TCDn_ATTR[DSIZE] = 2
TCDn_DLAST_SGA= -16
TCDn_CSR[INTMAJOR] = 1
TCDn_CSR[START] = 1 (Should be written last after all other fields have been initialized)
All other TCDn fields = 0
```

This generates the following event sequence:

1. User write to the `TCDn_CSR[START]` bit requests channel service.
2. The channel is selected by arbitration for servicing.
3. eDMA engine writes: `TCDn_CSR[DONE] = 0`, `TCDn_CSR[START] = 0`, `TCDn_CSR[ACTIVE] = 1`.
4. eDMA engine reads: channel TCD data from local memory to internal register file.
5. The source-to-destination transfers are executed as follows:
  - a. Read byte from location 0x1000, read byte from location 0x1001, read byte from 0x1002, read byte from 0x1003.
  - b. Write 32 bits to location 0x2000 → first iteration of the minor loop.
  - c. Read byte from location 0x1004, read byte from location 0x1005, read byte from 0x1006, read byte from 0x1007.
  - d. Write 32 bits to location 0x2004 → second iteration of the minor loop.
  - e. Read byte from location 0x1008, read byte from location 0x1009, read byte from 0x100A, read byte from 0x100B.
  - f. Write 32 bits to location 0x2008 → third iteration of the minor loop.
  - g. Read byte from location 0x100C, read byte from location 0x100D, read byte from 0x100E, read byte from 0x100F.
  - h. Write 32 bits to location 0x200C → last iteration of the minor loop → major loop complete.
6. The eDMA engine writes: `TCDn_SADDR = 0x1000`, `TCDn_DADDR = 0x2000`, `TCDn_CITER = 1` (`TCDn_BITER`).
7. The eDMA engine writes: `TCDn_CSR[ACTIVE] = 0`, `TCDn_CSR[DONE] = 1`, `INT[n] = 1`.
8. The channel retires and the eDMA goes idle or services the next channel.

### 6.4.4.2 Multiple requests

The following example transfers 32 bytes via two hardware requests, but is otherwise the same as the previous example. The only fields that change are the major loop iteration count and the final address offsets. The eDMA is programmed for two iterations of the major loop, transferring 16 bytes per iteration. After the channel's hardware requests are enabled in the ERQ register, the slave device initiates channel service requests.

```
TCDn_CITER = TCDn_BITER = 2
TCDn_SLAST = -32
TCDn_DLAST_SGA = -32
```

This would generate the following sequence of events:

1. First hardware, that is, the eDMA peripheral, requests channel service.
2. The channel is selected by arbitration for servicing.
3. eDMA engine writes:  $\text{TCD}_n\text{\_CSR[DONE]} = 0$ ,  $\text{TCD}_n\text{\_CSR[START]} = 0$ ,  $\text{TCD}_n\text{\_CSR[ACTIVE]} = 1$ .
4. eDMA engine reads: channel  $\text{TCD}_n$  data from local memory to internal register file.
5. The source to destination transfers are executed as follows:
  - a. Read byte from location 0x1000, read byte from location 0x1001, read byte from 0x1002, read byte from 0x1003.
  - b. Write 32 bits to location 0x2000 → first iteration of the minor loop.
  - c. Read byte from location 0x1004, read byte from location 0x1005, read byte from 0x1006, read byte from 0x1007.
  - d. Write 32 bits to location 0x2004 → second iteration of the minor loop.
  - e. Read byte from location 0x1008, read byte from location 0x1009, read byte from 0x100A, read byte from 0x100B.
  - f. Write 32 bits to location 0x2008 → third iteration of the minor loop.
  - g. Read byte from location 0x100C, read byte from location 0x100D, read byte from 0x100E, read byte from 0x100F.
  - h. Write 32 bits to location 0x200C → last iteration of the minor loop.
6. eDMA engine writes:  $\text{TCD}_n\text{\_SADDR} = 0x1010$ ,  $\text{TCD}_n\text{\_DADDR} = 0x2010$ ,  $\text{TCD}_n\text{\_CITER} = 1$ .
7. eDMA engine writes:  $\text{TCD}_n\text{\_CSR[ACTIVE]} = 0$ .
8. The channel retires → one iteration of the major loop. The eDMA goes idle or services the next channel.
9. Second hardware, that is, eDMA peripheral, requests channel service.
10. The channel is selected by arbitration for servicing.
11. eDMA engine writes:  $\text{TCD}_n\text{\_CSR[DONE]} = 0$ ,  $\text{TCD}_n\text{\_CSR[START]} = 0$ ,  $\text{TCD}_n\text{\_CSR[ACTIVE]} = 1$ .
12. eDMA engine reads channel TCD data from local memory to internal register file.
13. The source to destination transfers are executed as follows:

- a. Read byte from location 0x1010, read byte from location 0x1011, read byte from 0x1012, read byte from 0x1013.
  - b. Write 32 bits to location 0x2010 → first iteration of the minor loop.
  - c. Read byte from location 0x1014, read byte from location 0x1015, read byte from 0x1016, read byte from 0x1017.
  - d. Write 32 bits to location 0x2014 → second iteration of the minor loop.
  - e. Read byte from location 0x1018, read byte from location 0x1019, read byte from 0x101A, read byte from 0x101B.
  - f. Write 32 bits to location 0x2018 → third iteration of the minor loop.
  - g. Read byte from location 0x101C, read byte from location 0x101D, read byte from 0x101E, read byte from 0x101F.
  - h. Write 32 bits to location 0x201C → last iteration of the minor loop → major loop complete.
14. eDMA engine writes:  $TCDn\_SADDR = 0x1000$ ,  $TCDn\_DADDR = 0x2000$ ,  $TCDn\_CITER = 2$  ( $TCDn\_BITER$ ).
15. eDMA engine writes:  $TCDn\_CSR[ACTIVE] = 0$ ,  $TCDn\_CSR[DONE] = 1$ ,  $INT[n] = 1$ .
16. The channel retires → major loop complete. The eDMA goes idle or services the next channel.

#### 6.4.4.3 Using the modulo feature

The modulo feature of the eDMA provides the ability to implement a circular data queue in which the size of the queue is a power of 2. MOD is a 5-bit field for the source and destination in the TCD, and it specifies which lower address bits increment from their original value after the address+offset calculation. All upper address bits remain the same as in the original value. A setting of zero for this field disables the modulo feature.

The following table shows how the transfer addresses are specified based on the setting of the MOD field. Here a circular buffer is created where the address wraps to the original value while the 28 upper address bits (0x1234567x) retain their original value. In this example the source address is set to 0x12345670, the offset is set to 4 bytes, and the MOD field is set to 4, allowing for a  $2^4$  byte (16-byte) size queue.

**Table 6-7. Modulo example**

Transfer number	Address
1	0x12345670
2	0x12345674
3	0x12345678
4	0x1234567C

*Table continues on the next page...*

**Table 6-7. Modulo example (continued)**

Transfer number	Address
5	0x12345670
6	0x12345674

## 6.4.5 Monitoring transfer descriptor status

This section discusses how to monitor eDMA status.

### 6.4.5.1 Testing for minor loop completion

There are two methods to test for minor loop completion when using software-initiated service requests. The first is to read the  $\text{TCD}_n\_\text{CITER}$  field and test for a change. Another method may be extracted from the sequence shown below. The second method is to test  $\text{TCD}_n\_\text{CSR}[\text{START}]$  and  $\text{TCD}_n\_\text{CSR}[\text{ACTIVE}]$ . The minor-loop-complete condition is indicated by both bits reading zero after  $\text{TCD}_n\_\text{CSR}[\text{START}]$  was set. Polling the  $\text{TCD}_n\_\text{CSR}[\text{ACTIVE}]$  bit may be inconclusive, because the active status may be missed if the channel execution is short in duration.

The TCD status bits execute the following sequence for a software activated channel:

Stage	TCD $_n$ _CSR bits			State
	START	ACTIVE	DONE	
1	1	0	0	Channel service request via software
2	0	1	0	Channel is executing
3a	0	0	0	Channel has completed the minor loop and is idle
3b	0	0	1	Channel has completed the major loop and is idle

The best method to test for minor-loop completion when using service requests initiated by hardware, that is, peripherals, is to read the  $\text{TCD}_n\_\text{CITER}$  field and test for a change. The hardware request and acknowledge handshake signals are not visible in the programmer's model.

The TCD status bits execute the following sequence for a hardware-activated channel:

Stage	TCDn_CSR bits			State
	START	ACTIVE	DONE	
1	0	0	0	Channel service request via hardware (peripheral request asserted)
2	0	1	0	Channel is executing
3a	0	0	0	Channel has completed the minor loop and is idle
3b	0	0	1	Channel has completed the major loop and is idle

For both activation types, the major-loop-complete status is explicitly indicated via the TCDn\_CSR[DONE] bit.

The TCDn\_CSR[START] bit is cleared automatically when the channel begins execution regardless of how the channel activates.

#### 6.4.5.2 Reading the transfer descriptors of active channels

The eDMA reads back the true TCDn\_SADDR, TCDn\_DADDR, and TCDn\_NBUTES values if read when a channel executes. The true values of SADDR, DADDR, and NBUTES are the values the eDMA engine currently uses in its internal register file and not the values in the TCD local memory for that channel. The addresses, SADDR and DADDR, and NBUTES, which decrement to zero as the transfer progresses, can give an indication of the progress of the transfer. All other values are read back from the TCD local memory.

#### 6.4.5.3 Checking channel preemption status

Preemption is available only when fixed arbitration is selected for both group and channel arbitration modes. A preemptive situation is one in which a preempt-enabled channel runs and a higher priority request becomes active. When the eDMA engine is not operating in fixed group, fixed channel arbitration mode, determination of the actively running relative priority outstanding requests become undefined. Channel and/or group priorities are treated as equal, that is, constantly rotating, when Round-Robin Arbitration mode is selected.

The TCDn\_CSR[ACTIVE] bit for the preempted channel remains asserted throughout the preemption. The preempted channel is temporarily suspended while the preempting channel executes one major loop iteration. If two TCDn\_CSR[ACTIVE] bits are set simultaneously in the global TCD map, a higher priority channel is actively preempting a lower priority channel.

## 6.4.6 Channel linking

Channel linking (or chaining) is a mechanism where one channel sets the TCD $n$ \_CSR[START] bit of another channel (or itself), thus initiating a service request for that channel. When properly enabled, the EDMA engine automatically performs this operation at the major or minor loop completion.

The minor loop channel linking occurs at the completion of the minor loop (or one iteration of the major loop). The TCD $n$ \_CITER[ELINK] field determines whether a minor loop link is requested. When enabled, the channel link is made after each iteration of the major loop except for the last. When the major loop is exhausted, only the major loop channel link fields are used to determine if a channel link should be made. For example, the initial fields of:

```
TCDn_CITER [ELINK] = 1
TCDn_CITER [LINKCH] = 0xC
TCDn_CITER [CITER] value = 0x4
TCDn_CSR [MAJOR_ELINK] = 1
TCDn_CSR [MAJOR_LINKCH] = 0x3
```

executes as:

1. Minor loop done → set TCD2\_CSR[START] bit.
2. Minor loop done → set TCD2\_CSR[START] bit.
3. Minor loop done → set TCD2\_CSR[START] bit.
4. Minor loop done, major loop done → set TCD3\_CSR[START] bit.

When minor loop linking is enabled (TCD $n$ \_CITER[ELINK] = 1), the TCD $n$ \_CITER[CITER] field uses a nine-bit vector to form the current iteration count.

When minor loop linking is disabled (TCD $n$ \_CITER[ELINK] = 0), the TCD $n$ \_CITER[CITER] field uses a 15-bit vector to form the current iteration count. The bits associated with the TCD $n$ \_CITER[LINKCH] field are concatenated onto the CITER value to increase the range of the CITER.

### Note

The TCD $n$ \_CITER[ELINK] bit and the TCD $n$ \_BITER[ELINK] bit must be equal or a configuration error is reported. The CITER and BITER vector widths must be equal to calculate the major loop, half-way done interrupt point.

The following table summarizes how a DMA channel can link to another DMA channel, that is, use another channel's TCD, at the end of a loop.

**Table 6-8. Channel linking parameters**

Desired link behavior	TCD control field name	Description
Link at end of minor loop	CITER[ELINK]	Enable channel-to-channel linking on minor loop completion (current iteration)
	CITER[LINKCH]	Link channel number when linking at end of minor loop (current iteration)
Link at end of major loop	CSR[MAJOR_ELINK]	Enable channel-to-channel linking on major loop completion
	CSR[MAJOR_LINKCH]	Link channel number when linking at end of major loop

## 6.4.7 Dynamic programming

This section provides recommended methods to change the programming model during channel execution.

### 6.4.7.1 Dynamically changing the channel priority

The following two options are recommended for dynamically changing channel priority levels:

1. Switch to Round-Robin Channel Arbitration mode, change the channel priorities, then switch back to Fixed Arbitration mode
2. Disable all the channels, change the channel priorities, then enable the appropriate channels.

### 6.4.7.2 Dynamic channel linking

Dynamic channel linking is the process of setting [TCDn\\_CSR\[MAJORELINK\]](#) during channel execution (see the diagram in [TCD structure](#)). This field is read from the TCD local memory at the end of channel execution, thus enabling you to enable the feature during channel execution.

Because you can change the configuration during execution, a coherency model is needed. Consider the scenario where you attempt to execute a dynamic channel link by enabling [TCDn\\_CSR\[MAJORELINK\]](#) at the same time the eDMA engine is retiring the channel. [TCDn\\_CSR\[MAJORELINK\]](#) would be set in the programmer's model, but it would be unclear whether the actual link was made before the channel retired.

The following coherency model is recommended when executing a dynamic channel link request.

1. Write one to TCDn\_CSR[MAJORELINK].
2. Read back TCDn\_CSR[MAJORELINK].
3. Test the TCDn\_CSR[MAJORELINK] request status:
  - If TCDn\_CSR[MAJORELINK] = 1, the dynamic link attempt was successful.
  - If TCDn\_CSR[MAJORELINK] = 0, the attempted dynamic link did not succeed (the channel was already retiring).

For this request, the TCD local memory controller forces TCDn\_CSR[MAJORELINK] to zero on any writes to a channel's TCD.word7 after that channel's TCD.done bit is set, indicating the major loop is complete.

#### **NOTE**

You must clear [TCDn\\_CSR\[DONE\]](#) before writing [TCDn\\_CSR\[MAJORELINK\]](#). The eDMA engine automatically clears [TCDn\\_CSR\[DONE\]](#) after a channel begins execution.

#### **6.4.7.3 Dynamic scatter/gather**

Scatter/gather is the process of automatically loading a new TCD into a channel. It enables a DMA channel to use multiple TCDs; this enables a DMA channel to scatter the DMA data to multiple destinations or gather it from multiple sources. When scatter/gather is enabled and the channel has finished its major loop, a new TCD is fetched from system memory and loaded into that channel's descriptor location in eDMA programmer's model, thus replacing the current descriptor.

Because you are able to change the configuration during execution, a coherency model is needed. Consider the scenario where you attempt to execute a dynamic scatter/gather operation by enabling the [TCDn\\_CSR\[ESG\]](#) bit at the same time the eDMA engine is retiring the channel. The ESG bit would be set in the programmer's model, but it would be unclear whether the actual scatter/gather request was honored before the channel retired.

Two methods for this coherency model are shown in the following subsections. Method 1 has the advantage of reading the MAJORLINKCH field and the ESG bit with a single read. For both dynamic channel linking and scatter/gather requests, the TCD local memory controller forces the TCD MAJOR[ELINK] and ESG bits to zero on any writes to a channel's TCD word 7 if that channel's TCD[DONE] bit is set, indicating the major loop is complete.

**NOTE**

The user must clear the [TCDn\\_CSR\[DONE\]](#) bit before writing the MAJORELINK or ESG bits. The TCDn\_CSR[DONE] bit is cleared automatically by the eDMA engine after a channel begins execution.

#### **6.4.7.3.1 Method 1 (channel not using major loop channel linking)**

For a channel not using major loop channel linking, the coherency model described here may be used for a dynamic scatter/gather request.

When [TCDn\\_CSR\[MAJORELINK\]](#) is zero, TCDn\_CSR[MAJORLINKCH] is not used by the eDMA. In this case, MAJORLINKCH may be used for other purposes. This method uses the MAJORLINKCH field as a TCD identification (ID).

1. When the descriptors are built, write a unique TCD ID in TCDn\_CSR[MAJORLINKCH] for each TCD associated with a channel using dynamic scatter/gather.
2. Write one to [TCDn\\_CSR\[DREQ\]](#).

Should a dynamic scatter/gather attempt fail, setting the DREQ bit prevents a future hardware activation of the channel. This stops the channel from executing with a destination address (DADDR) that was calculated using a scatter/gather address (written in the next step) instead of a DLAST\_SGA final offset value.

3. Write the [TCDn\\_DLASTSGA](#) register with the scatter/gather address.
4. Write one to TCDn\_CSR[ESG].
5. Read back the 16-bit TCD control/status field.
6. Test the ESG request status and MAJORLINKCH value in the TCDn\_CSR register:

If ESG = 1, the dynamic link attempt was successful.

If ESG = 0 and MAJORLINKCH (ID) did not change, the attempted dynamic link did not succeed (the channel was already retiring).

If ESG = 0 and MAJORLINKCH (ID) changed, the dynamic link attempt was successful (the new TCD's ESG value cleared the ESG bit).

#### **6.4.7.3.2 Method 2 (channel using major loop channel linking)**

For a channel using major loop channel linking, the coherency model described here may be used for a dynamic scatter/gather request. This method uses the TCD[DLAST\_SGA] field as a TCD identification (ID).

1. Write one to [TCDn\\_CSR\[DREQ\]](#).

Should a dynamic scatter/gather attempt fail, setting TCDn\_CSR[DREQ] prevents a future hardware activation of the channel. This stops the channel from executing with a destination address (DADDR) that was calculated using a scatter/gather address (written in the next step) instead of a DLAST\_SGA final offset value.

2. Write the [TCDn\\_DLAST\\_SGA](#) register with the scatter/gather address.
3. Write one to TCDn\_CSR[ESG].
4. Read back TCDn\_CSR[ESG].
5. Test the ESG request status:

If ESG = 1, the dynamic link attempt was successful.

If ESG = 0, read the 32-bit TCDn\_DLAST\_SGA field.

If ESG = 0 and TCDn\_DLAST\_SGA did not change, the attempted dynamic link did not succeed (the channel was already retiring).

If ESG = 0 and TCDn\_DLAST\_SGA changed, the dynamic link attempt was successful (the new TCD's ESG value cleared the ESG bit).

## 6.4.8 Suspend/resume a DMA channel with active hardware service requests

The DMA enables you to move data from memory or peripheral registers to another location in memory or peripheral registers without CPU interaction. After the DMA and peripherals have been configured and are active, it is rare to suspend a peripheral's service request dynamically. In this scenario, there are certain restrictions to disabling a DMA hardware service request. For coherency, a specific procedure must be followed. This section provides guidance on how to coherently suspend and resume a Direct Memory Access (DMA) channel when the DMA is triggered by a slave module such as the Serial Peripheral Interface (SPI), ADC, or other module.

### 6.4.8.1 Suspend an active DMA channel

To suspend an active DMA channel:

1. Stop the DMA service request at the peripheral first. Confirm it has been disabled by reading back the appropriate register in the peripheral.
2. Check the DMA's Hardware Request Status register (DMA\_HRSn) to ensure there is no service request to the DMA channel being suspended. Then disable the hardware service request by clearing the ERQ bit on appropriate DMA channel.

### 6.4.8.2 Resume a DMA channel

To resume a DMA channel:

1. Enable the DMA service request on the appropriate channel by setting the relevant ERQ bit.
2. Enable the DMA service request at the peripheral.

For example, assume the SPI is set as a master for transmitting data via a DMA service request when the SPI\_TXFIFO has an empty slot. The DMA transfers the next command and data to the TXFIFO upon the request. You must suspend the DMA/SPI transfer loop and perform the following steps:

1. Disable the DMA service request at the source by writing zero to SPI\_RSER[TFFF\_RE]. Confirm that SPI\_RSER[TFFF\_RE] is zero.
2. Ensure there is no DMA service request from the SPI by verifying that DMA\_HRS[HRS<sub>n</sub>] is zero for the appropriate channel. If no service request is present, disable the DMA channel by clearing the channel's ERQ bit. If a service request is present, wait until the request has been processed and the HRS bit reads zero.

## 6.5 Memory map/register definition

The eDMA programming model consists of registers that provide:

- Control and status functions
- Channel configuration functions
- TCD definition functions

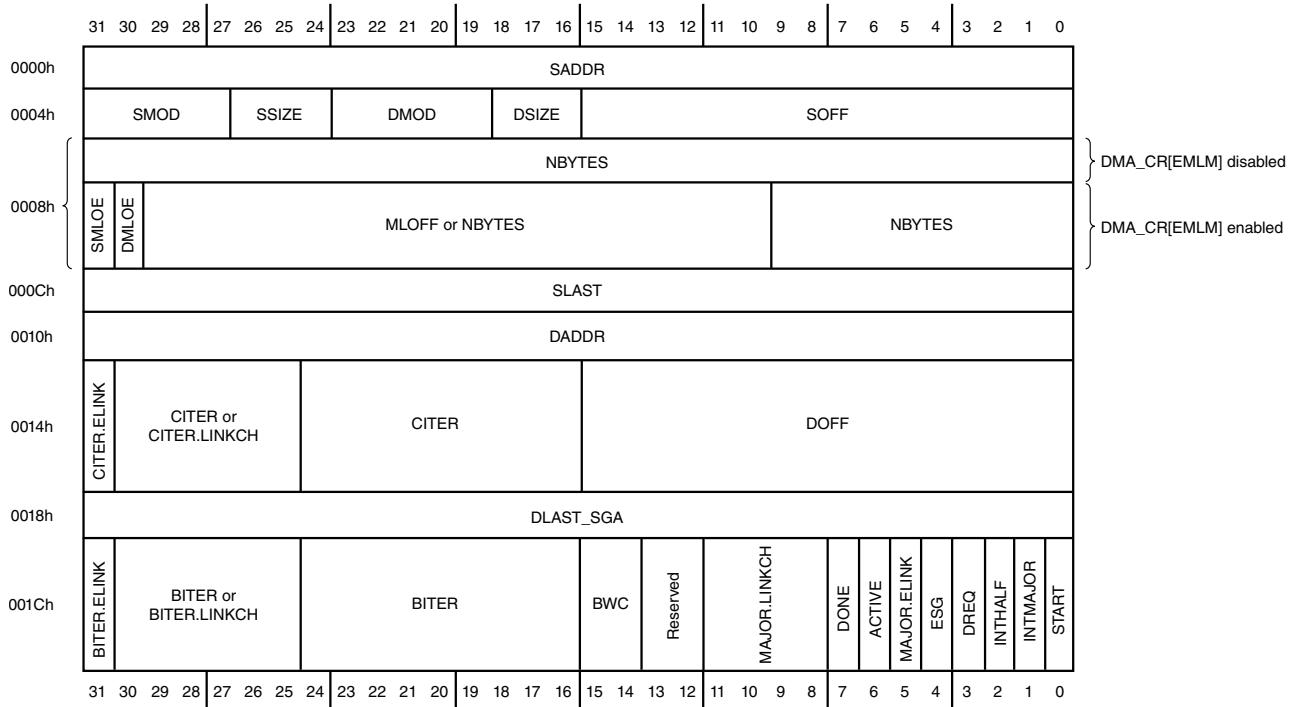

### 6.5.1 TCD memory

Each channel requires a 32-byte TCD to define the desired data movement operation. The channel descriptors are in local memory in sequential order: channel 0, channel 1, ... channel 31. Each TCD<sub>n</sub> definition comprises 11 registers of 16 or 32 bits.

### 6.5.2 TCD initialization

Before activating a channel, you must initialize its TCD with the appropriate transfer profile.

### 6.5.3 TCD structure

### 6.5.4 Reserved memory and fields

- Reading reserved fields in a register returns the value of zero.
- The eDMA ignores writes to reserved bits in a register.
- Reading or writing a reserved memory location generates a bus error.

### 6.5.5 DMA register descriptions

#### 6.5.5.1 DMA memory map

DMA base address: 400E\_8000h

Offset	Register	Width (in bits)	Access	Reset value
0h	Control (CR)	32	RW	<a href="#">Table 6-8</a>

### 6.5.5.2 Control (CR)

### 6.5.5.2.1 Offset

Register	Offset
CR	0h

### 6.5.5.2.2 Function

This register defines the basic operating configuration of the eDMA module. eDMA arbitrates channel service requests in two groups of 16 channels each:

- Group 1 contains channels 31-16
- Group 0 contains channels 15-0

You can configure arbitration within a group to use either a fixed-priority or a round-robin scheme. For fixed-priority arbitration, eDMA selects and executes the highest-priority channel that requests service. The channel priority registers assign the priorities (see the [Channel Priority \(DCHPRI0 - DCHPRI31\) registers](#)). For round-robin arbitration, the eDMA engine ignores channel priorities and cycles through channels within each group from high to low channel number without regard to priority.

#### NOTE

For correct operation, you must write to this register only when the eDMA channels are inactive—that is, when `TCDn_CSR[ACTIVE] = 0`.

The group priorities operate in a similar fashion. In group fixed priority arbitration mode, channel service requests in the highest priority group are executed first, where priority level 1 is the highest and priority level 0 is the lowest. The group priorities are assigned in the `GRPnPRI` fields of the Control register (CR). All group priorities must have unique values prior to any channel service requests occurring; otherwise, a configuration error is reported. For group round robin arbitration, eDMA ignores the group priorities and the groups are cycled through (from high to low group number) without regard to priority.

Minor loop offsets are address-offset values to be added to the final source address (`TCDn_SADDR`) or destination address (`TCDn_DADDR`) when the minor loop completes. When you enable minor loop offsets, eDMA adds the minor loop offset (`MLOFF`) value to the final source address (`TCDn_SADDR`), to the final destination address (`TCDn_DADDR`), or to both, before it writes the addresses back into the TCD. If the major loop is complete, eDMA ignores the minor loop offset, and uses the major loop address offsets (`TCDn_SLAST` and `TCDn_DLST_SGA`) to compute the next `TCDn_SADDR` and `TCDn_DADDR` values.

Enabling minor loop mapping (`EMLM = 1`) redefines `TCDn word2`. eDMA uses a portion of `TCDn word2` for multiple fields:

- A source enable field (SMLOE) to specify the minor loop offset is to be applied to the source address (TCDn\_SADDR) when the minor loop completes
- A destination enable field (DMLOE) to specify the minor loop offset to be applied to the destination address (TCDn\_DADDR) when the minor loop completes
- The sign extended minor loop offset value (Mloff).

eDMA uses the same offset value (Mloff) for both source and destination minor loop offsets. When you enable either minor loop offset (SMLOE = 1 or DMLOE = 1), the NBYTES field reduces in size to 10 bits. When you disable both minor loop offsets (SMLOE = 0 and DMLOE = 0), the NBYTES field is a 30-bit vector.

When you disable minor loop mapping (EMLM = 0), the NBYTES field contains all 32 bits of TCDn word2.

	<ul style="list-style-type: none"> <li>Stop the executing channel</li> <li>Force the minor loop to finish.</li> </ul> <p>The cancellation takes effect after the last write of the current read/write sequence. This field is automatically written with 0 after the cancellation completes. The cancellation retires the channel normally as if the minor loop completed.            0b - Normal operation            1b - Cancel the remaining data transfer</p>
16 ECX	<p>Error Cancel Transfer</p> <p>When you write a 1 to this field, the following actions take place:</p> <ul style="list-style-type: none"> <li>Stop the executing channel</li> <li>Force the minor loop to finish.</li> </ul> <p>The cancellation takes effect after the last write of the current read/write sequence. This field is automatically reset to 0 after the cancellation completes. In addition to cancelling the transfer, eDMA:</p> <ul style="list-style-type: none"> <li>Treats the cancel as an error condition</li> <li>Updates the Error Status register (DMAx_ES)</li> <li>Optionally generates an error interrupt.</li> </ul> <p>0b - Normal operation            1b - Cancel the remaining data transfer</p>
15-11 —	Reserved
10 GRP1PRI	<p>Channel Group 1 Priority</p> <p>Group 1 priority level when fixed priority group arbitration is enabled.</p>
9 —	Reserved
8 GRP0PRI	<p>Channel Group 0 Priority</p> <p>Group 0 priority level when fixed priority group arbitration is enabled.</p>
7 EMLM	<p>Enable Minor Loop Mapping</p> <p>When the value of this field is 0, TCDn.word2 is a 32-bit NBYTES field. When the value of this field is 1, TCDn.word2 includes:</p> <ul style="list-style-type: none"> <li>Individual enable fields</li> <li>An offset field</li> <li>The NBYTES field.</li> </ul> <p>The individual enable fields allow the minor loop offset to be applied to the source address, the destination address, or both. The NBYTES field reduces in size when either offset is enabled.            0b - Disabled            1b - Enabled</p>
6 CLM	<p>Continuous Link Mode</p> <p>When the value of this field is 0, a minor loop channel link made to itself goes through channel arbitration before being activated again. When the value of this field is 1, a minor loop channel link made to itself does not go through channel arbitration before being activated again. When the minor loop completes, the channel activates again if that channel has a minor loop channel link enabled and the link channel is itself. This effectively applies the minor loop offsets and restarts the next minor loop.</p> <p><b>NOTE:</b> Do not use continuous link mode with a channel linking to itself if there is only one minor loop iteration per service request, for example, if the channel's NBYTES value is the same as either the source or destination size. The same data transfer profile can be achieved by simply increasing the NBYTES value, which provides more efficient, faster processing.</p> <p>0b - Continuous link mode is off</p>

Table continues on the next page...

Field	Function
	1b - Continuous link mode is on
5 HALT	<p>Halt eDMA Operations</p> <p>When this field is 1 the following actions take place:</p> <ul style="list-style-type: none"> <li>• eDMA stalls the start of any new channels</li> <li>• Executing channels are allowed to complete.</li> </ul> <p>When you write 0 to this field, channel execution resumes.</p> <p>0b - Normal operation 1b - eDMA operations halted</p>
4 HOE	<p>Halt On Error</p> <p>When this field is 1, any error causes the eDMA engine to write 1 to the HALT field. Subsequently, the eDMA engine ignores all service requests until you write 0 to the HALT field.</p> <p>0b - Normal operation 1b - Error causes HALT field to be automatically set to 1</p>
3 ERGA	<p>Enable Round Robin Group Arbitration</p> <p>When you write 1 to this field, eDMA uses round robin arbitration for selection among the groups. Otherwise, eDMA uses fixed priority arbitration.</p> <p>0b - Fixed priority arbitration 1b - Round robin arbitration</p>
2 ERCA	<p>Enable Round Robin Channel Arbitration</p> <p>When you write 1 to this field, eDMA uses round robin arbitration for channel selection. Otherwise, eDMA uses fixed priority arbitration for channel selection.</p> <p>0b - Fixed priority arbitration within each group 1b - Round robin arbitration within each group</p>
1 EDBG	<p>Enable Debug</p> <p>When this field is 0 and the chip enters Debug mode, eDMA continues operation. When this field is 1, entry of the chip into Debug mode causes the eDMA to stall the start of a new channel. Executing channels are allowed to complete. Channel execution resumes when the chip exits Debug mode or you write 0 to this field.</p> <p>0b - When the chip is in Debug mode, the eDMA continues to operate. 1b - When the chip is in debug mode, the DMA stalls the start of a new channel. Executing channels are allowed to complete.</p>
0 —	Reserved

### 6.5.5.3 Error Status (ES)

#### 6.5.5.3.1 Offset

Register	Offset
ES	4h

### 6.5.5.3.2 Function

The ES register provides information concerning the most-recently recorded channel error. Channel errors can be caused by:

- A configuration error, that is:
  - An illegal setting in the transfer-control descriptor
  - An illegal priority register setting in fixed arbitration
- An error termination to a bus master read or write cycle
- A cancel transfer with error field that is 1 when a transfer is canceled via the corresponding cancel transfer control field

See [Fault reporting and handling](#) for more details.

### 6.5.5.3.4 Fields

Field	Function
31 VLD	Logical OR of all ERR status fields 0b - No ERR fields are 1 1b - At least one ERR field has a value of 1, indicating a valid error exists that has not been cleared
30-17 —	Reserved
16 ECX	Transfer Canceled 0b - No canceled transfers 1b - The most-recently recorded entry was a canceled transfer initiated by the error cancel transfer field
15 GPE	Group Priority Error 0b - No group priority error. 1b - The most-recently recorded error was a configuration error among the group priorities. All group priorities are not unique.
14 CPE	Channel Priority Error 0b - No channel priority error. 1b - The most-recently recorded error was a configuration error in the channel priorities within a group. Channel priorities within a group are not unique.

Table continues on the next page...

Field	Function
13 —	Reserved
12-8 ERRCHN	Error Channel Number or Canceled Channel Number The channel number of the most-recently recorded error, excluding GPE and CPE errors or most-recently recorded error canceled transfer.
7 SAE	Source Address Error 0b - No source address configuration error. 1b - The most-recently recorded error was a configuration error detected in the TCDn_SADDR field. TCDn_SADDR is inconsistent with TCDn_ATTR[SSIZE].
6 SOE	Source Offset Error 0b - No source offset configuration error. 1b - The most-recently recorded error was a configuration error detected in the TCDn_SOFF field. TCDn_SOFF is inconsistent with TCDn_ATTR[SSIZE].
5 DAE	Destination Address Error 0b - No destination address configuration error. 1b - The most-recently recorded error was a configuration error detected in the TCDn_DADDR field. TCDn_DADDR is inconsistent with TCDn_ATTR[DSIZE].
4 DOE	Destination Offset Error 0b - No destination offset configuration error. 1b - The most-recently recorded error was a configuration error detected in the TCDn_DOFF field. TCDn_DOFF is inconsistent with TCDn_ATTR[DSIZE].
3 NCE	NBYTES/CITER Configuration Error 0b - No NBYTES/CITER configuration error. 1b - The most-recently recorded error was a configuration error detected in the TCDn_NBYTES or TCDn_CITER fields. TCDn_NBYTES is not a multiple of TCDn_ATTR[SSIZE] and TCDn_ATTR[DSIZE], or TCDn_CITER[CITER] = 0, or TCDn_CITER[ELINK] is not equal to TCDn_BITER[ELINK].
2 SGE	Scatter/Gather Configuration Error When 1, this field indicates the most-recently recorded error was a configuration error detected in the TCDn_DLASTSGA field. eDMA checks This field at the beginning of a scatter/gather operation after major loop completion if TCDn_CSR[ESG] is enabled. TCDn_DLASTSGA is not on a 32-byte boundary. 0b - No scatter/gather configuration error. 1b - The most-recently recorded error was a configuration error detected in the TCDn_DLASTSGA field.
1 SBE	Source Bus Error 0b - No source bus error. 1b - The most-recently recorded error was a bus error on a source read.
0 DBE	Destination Bus Error 0b - No destination bus error. 1b - The most-recently recorded error was a bus error on a destination write.

#### 6.5.5.4 Enable Request (ERQ)

### 6.5.5.4.1 Offset

Register	Offset
ERQ	Ch

### 6.5.5.4.2 Function

The ERQ register provides a bit map for the 32 channels to enable the request signal for each channel. The state of any given channel enable is directly affected by writes to this register; it is also affected by writes to the SERQ and CERQ registers. These registers are provided so the request enable for a single channel can easily be modified without needing to perform a read-modify-write sequence to this register.

DMA request input signals and this enable request field must be set to 1 before a channel's hardware service request is accepted. The state of the DMA enable request field does not affect a channel service request made explicitly through software or a linked channel request.

#### NOTE

Disable a channel's hardware service request at the source before writing 0 to the channel's ERQ field.

### 6.5.5.5 Enable Error Interrupt (EEI)

### 6.5.5.5.1 Offset

Register	Offset
EEI	14h

### 6.5.5.5.2 Function

The EEI register provides a bit map for the 32 channels to enable the error interrupt signal for each channel. The state of any given channel's error interrupt enable is directly affected by writes to this register; it is also affected by writes to the SEEI and CEEI registers. These registers are provided so that the error interrupt enable for a single channel can easily be modified without the need to perform a read-modify-write sequence to the EEI register.

The DMA error indicator and the error interrupt enable field must be set to 1 before an error interrupt request for a given channel is sent to the interrupt controller.

### 6.5.5.5.4 Fields

Field	Function
31 EEI31	Enable Error Interrupt 31 0b - An error on channel 31 does not generate an error interrupt 1b - An error on channel 31 generates an error interrupt request
30 EEI30	Enable Error Interrupt 30 0b - An error on channel 30 does not generate an error interrupt 1b - An error on channel 30 generates an error interrupt request
29 EEI29	Enable Error Interrupt 29 0b - An error on channel 29 does not generate an error interrupt 1b - An error on channel 29 generates an error interrupt request

Table continues on the next page...

## Memory map/register definition

Field	Function
28 EEI28	Enable Error Interrupt 28 0b - An error on channel 28 does not generate an error interrupt 1b - An error on channel 28 generates an error interrupt request
27 EEI27	Enable Error Interrupt 27 0b - An error on channel 27 does not generate an error interrupt 1b - An error on channel 27 generates an error interrupt request
26 EEI26	Enable Error Interrupt 26 0b - An error on channel 26 does not generate an error interrupt 1b - An error on channel 26 generates an error interrupt request
25 EEI25	Enable Error Interrupt 25 0b - An error on channel 25 does not generate an error interrupt 1b - An error on channel 25 generates an error interrupt request
24 EEI24	Enable Error Interrupt 24 0b - An error on channel 24 does not generate an error interrupt 1b - An error on channel 24 generates an error interrupt request
23 EEI23	Enable Error Interrupt 23 0b - An error on channel 23 does not generate an error interrupt 1b - An error on channel 23 generates an error interrupt request
22 EEI22	Enable Error Interrupt 22 0b - An error on channel 22 does not generate an error interrupt 1b - An error on channel 22 generates an error interrupt request
21 EEI21	Enable Error Interrupt 21 0b - An error on channel 21 does not generate an error interrupt 1b - An error on channel 21 generates an error interrupt request
20 EEI20	Enable Error Interrupt 20 0b - An error on channel 20 does not generate an error interrupt 1b - An error on channel 20 generates an error interrupt request
19 EEI19	Enable Error Interrupt 19 0b - An error on channel 19 does not generate an error interrupt 1b - An error on channel 19 generates an error interrupt request
18 EEI18	Enable Error Interrupt 18 0b - An error on channel 18 does not generate an error interrupt 1b - An error on channel 18 generates an error interrupt request
17 EEI17	Enable Error Interrupt 17 0b - An error on channel 17 does not generate an error interrupt 1b - An error on channel 17 generates an error interrupt request
16 EEI16	Enable Error Interrupt 16 0b - An error on channel 16 does not generate an error interrupt 1b - An error on channel 16 generates an error interrupt request
15 EEI15	Enable Error Interrupt 15 0b - An error on channel 15 does not generate an error interrupt 1b - An error on channel 15 generates an error interrupt request
14 EEI14	Enable Error Interrupt 14 0b - An error on channel 14 does not generate an error interrupt 1b - An error on channel 14 generates an error interrupt request
13 EEI13	Enable Error Interrupt 13 0b - An error on channel 13 does not generate an error interrupt 1b - An error on channel 13 generates an error interrupt request
12 EEI12	Enable Error Interrupt 12 0b - An error on channel 12 does not generate an error interrupt

Table continues on the next page...

Field	Function
	1b - An error on channel 12 generates an error interrupt request
11 EEI11	Enable Error Interrupt 11 0b - An error on channel 11 does not generate an error interrupt 1b - An error on channel 11 generates an error interrupt request
10 EEI10	Enable Error Interrupt 10 0b - An error on channel 10 does not generate an error interrupt 1b - An error on channel 10 generates an error interrupt request
9 EEI9	Enable Error Interrupt 9 0b - An error on channel 9 does not generate an error interrupt 1b - An error on channel 9 generates an error interrupt request
8 EEI8	Enable Error Interrupt 8 0b - An error on channel 8 does not generate an error interrupt 1b - An error on channel 8 generates an error interrupt request
7 EEI7	Enable Error Interrupt 7 0b - An error on channel 7 does not generate an error interrupt 1b - An error on channel 7 generates an error interrupt request
6 EEI6	Enable Error Interrupt 6 0b - An error on channel 6 does not generate an error interrupt 1b - An error on channel 6 generates an error interrupt request
5 EEI5	Enable Error Interrupt 5 0b - An error on channel 5 does not generate an error interrupt 1b - An error on channel 5 generates an error interrupt request
4 EEI4	Enable Error Interrupt 4 0b - An error on channel 4 does not generate an error interrupt 1b - An error on channel 4 generates an error interrupt request
3 EEI3	Enable Error Interrupt 3 0b - An error on channel 3 does not generate an error interrupt 1b - An error on channel 3 generates an error interrupt request
2 EEI2	Enable Error Interrupt 2 0b - An error on channel 2 does not generate an error interrupt 1b - An error on channel 2 generates an error interrupt request
1 EEI1	Enable Error Interrupt 1 0b - An error on channel 1 does not generate an error interrupt 1b - An error on channel 1 generates an error interrupt request
0 EEI0	Enable Error Interrupt 0 0b - An error on channel 0 does not generate an error interrupt 1b - An error on channel 0 generates an error interrupt request

### 6.5.5.6 Clear Enable Error Interrupt (CEEI)

#### 6.5.5.6.1 Offset

Register	Offset
CEEI	18h

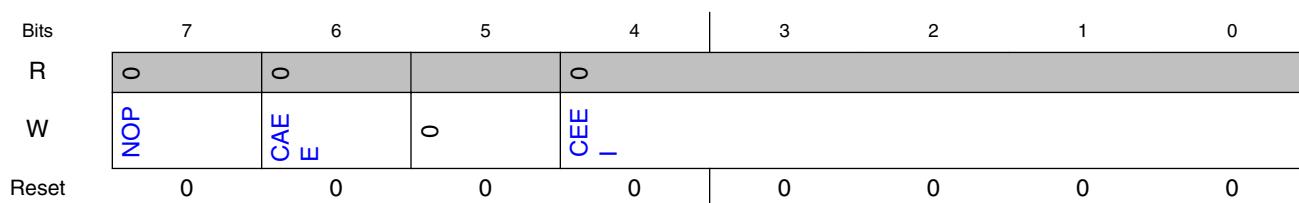

### 6.5.5.6.2 Function

The CEEI provides a simple memory-mapped mechanism to write 0 to a given field in the EEI register to disable the error interrupt for a given channel. The data value on a register write causes the corresponding field in the EEI register to be written to 0. Writing 1 to the CAEE field provides a global clear to 0 function, forcing the EEI contents to be written to 0, disabling all DMA request inputs.

If the NOP field is written with 1, the command is ignored. This enables you to write 1 to a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word must all have their NOP field set to 1 so that these registers are not affected by the write.

Reads of this register return all zeroes.

### 6.5.5.6.3 Diagram

### 6.5.5.6.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation, ignore the other fields in this register
6 CAEE	Clear All Enable Error Interrupts 0b - Write 0 only to the EEI field specified in the CEEI field 1b - Write 0 to all fields in EEI
5 —	Reserved
4-0 CEEI	Clear Enable Error Interrupt Writes 0 to the corresponding field in EEI

### 6.5.5.7 Set Enable Error Interrupt (SEEI)

### 6.5.5.7.1 Offset

Register	Offset
SEEI	19h

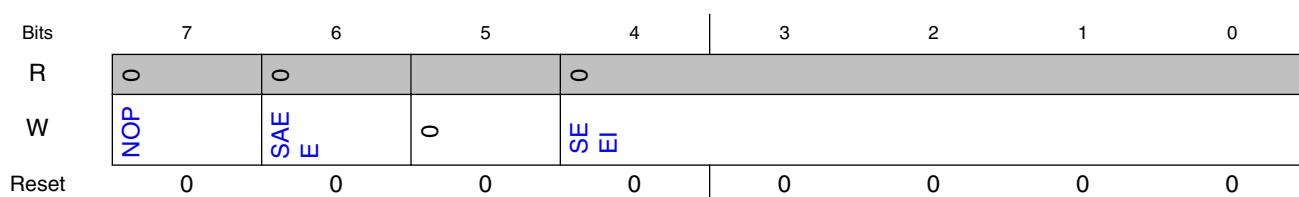

### 6.5.5.7.2 Function

The SEEI register provides a simple memory-mapped mechanism to write 1 to a given field in the EEI register to enable the error interrupt for a given channel. The data value on a register write causes the corresponding field in the EEI to be written to 1. Writing 1 to the SAEE field provides a global set to 1 function, forcing the entire EEI register contents to be written with 1.

If the NOP field is 1, the command is ignored. This enables you to write 1 to a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word must all have their NOP field set to 1 so that these registers are not affected by the write.

Reads of this register return all zeroes.

### 6.5.5.7.3 Diagram

### 6.5.5.7.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation, ignore the other fields in this register
6 SAEE	Set All Enable Error Interrupts 0b - Write 1 only to the EEI field specified in the SEEI field 1b - Writes 1 to all fields in EEI
5 —	Reserved
4-0 SEEI	Set Enable Error Interrupt Writes 1 to the corresponding field in EEI

## 6.5.5.8 Clear Enable Request (CERQ)

### 6.5.5.8.1 Offset

Register	Offset
CERQ	1Ah

### 6.5.5.8.2 Function

The CERQ provides a simple memory-mapped mechanism to write 0 to a given field in the ERQ register to disable the DMA request for a given channel. The data value on a register write causes the corresponding field in the ERQ register to be written with 0. Setting the CAER field provides a global clear to 0 function, forcing the entire contents of the ERQ register to be written with 0, disabling all DMA request inputs.

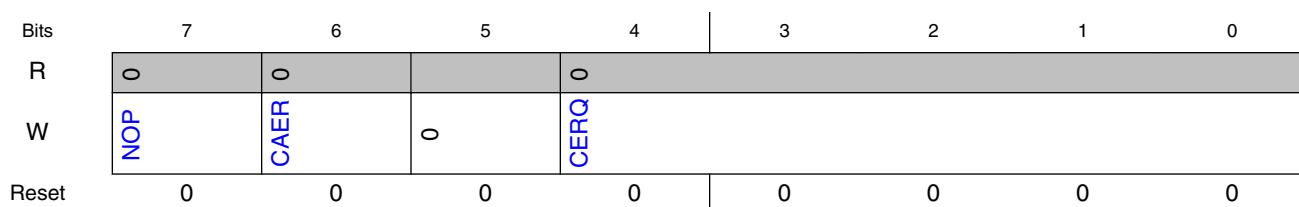

If the NOP field is 1, the command is ignored. This enables you to write 1 to a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word must all have their NOP field written with 1 so that these registers are not affected by the write.

Reads of this register return all zeroes.

#### NOTE

Disable a channel's hardware service request at the source before writing 0 to the channel's ERQ field.

### 6.5.5.8.3 Diagram

### 6.5.5.8.4 Fields

Field	Function
7	No Op Enable 0b - Normal operation

Table continues on the next page...

Field	Function
NOP	1b - No operation, ignore the other fields in this register
6 CAER	Clear All Enable Requests 0b - Write 0 to only the ERQ field specified in the CERQ field 1b - Write 0 to all fields in ERQ
5 —	Reserved
4-0 CERQ	Clear Enable Request Writes 0 to the corresponding field in ERQ.

## 6.5.5.9 Set Enable Request (SERQ)

### 6.5.5.9.1 Offset

Register	Offset
SERQ	1Bh

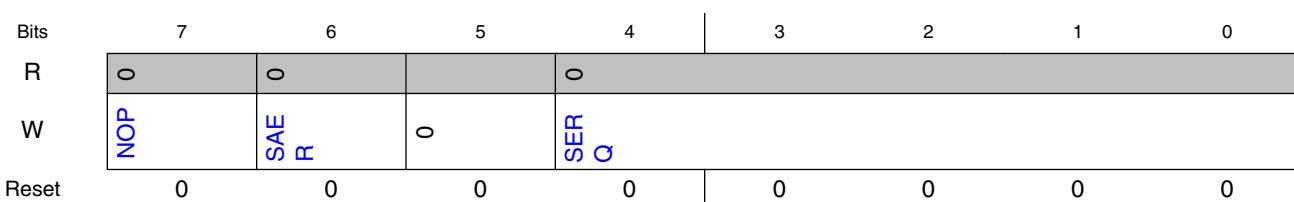

### 6.5.5.9.2 Function

The SERQ provides a simple memory-mapped mechanism to write 1 to a given field in the ERQ register to enable the DMA request for a given channel. The data value on a register write causes the corresponding field in the ERQ register to be set. Writing 1 to the SAER field provides a global set to 1 function, forcing the entire contents of ERQ register to be 1.

If the NOP field is 1, the command is ignored. This enables you to write 1 to a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word must all have their NOP field written with 1 so that these registers are not affected by the write.

Reads of this register returns all zeroes.

### 6.5.5.9.3 Diagram

### 6.5.5.9.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation, ignore the other fields in this register
6 SAER	Set All Enable Requests 0b - Write 1 to only the ERQ field specified in the SERQ field 1b - Write 1 to all fields in ERQ
5 —	Reserved
4-0 SERQ	Set Enable Request Writes 1 to the corresponding field in ERQ.

### 6.5.5.10 Clear DONE Status Bit (CDNE)

#### 6.5.5.10.1 Offset

Register	Offset
CDNE	1Ch

#### 6.5.5.10.2 Function

The CDNE provides a simple memory-mapped mechanism to write 0 to the DONE field in the TCD of the given channel. The data value on a register write causes the DONE field in the corresponding TCD to be written with 0. Writing 1 to the CADN field provides a global clear function, forcing all DONE fields to be written with 0.

If the NOP field is 1, the command is ignored. This enables you to write 1 to a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word must all have their NOP field written with 1 so that these registers are not affected by the write.

Reads of this register return all zeroes.

### 6.5.5.10.3 Diagram

Bits	7	6	5	4		3	2	1	0
R	o	o		o					
W	NOP	CADN	o	CDNE					
Reset	0	0	0	0		0	0	0	0

### 6.5.5.10.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation; all other fields in this register are ignored.
6 CADN	Clears All DONE fields 0b - Writes 0 to only the TCDn_CSR[DONE] field specified in the CDNE field 1b - Writes 0 to all bits in TCDn_CSR[DONE]
5 —	Reserved
4-0 CDNE	Clear DONE field Writes 0 to the corresponding field in TCDn_CSR[DONE]

### 6.5.5.11 Set START Bit (SSRT)

#### 6.5.5.11.1 Offset

Register	Offset
SSRT	1Dh

#### 6.5.5.11.2 Function

The SSRT register provides a simple memory-mapped mechanism to write 1 to the START field in the TCD of the given channel. The data value on a register write causes the START field in the corresponding TCD to be written with 1. Writing 1 to the SAST field provides a global set to 1 function, forcing all START fields to be written with 1.

## Memory map/register definition

If the NOP field is 1, the command is ignored. This enables you to write 1 to a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word must all have their NOP field written with 1 so that these registers are not affected by the write.

Reads of this register return all zeroes.

### 6.5.5.11.3 Diagram

Bits	7	6	5	4		3	2	1	0
R	o	o		o					
W	NOP	SAS T	o	SSR T					
Reset	0	0	0	0		0	0	0	0

### 6.5.5.11.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation; all other fields in this register are ignored.
6 SAST	Set All START fields (activates all channels) 0b - Write 1 to only the TCDn_CSR[START] field specified in the SSRT field 1b - Write 1 to all bits in TCDn_CSR[START]
5 —	Reserved
4-0 SSRT	Set START field Sets the corresponding field in TCDn_CSR[START]

### 6.5.5.12 Clear Error (CERR)

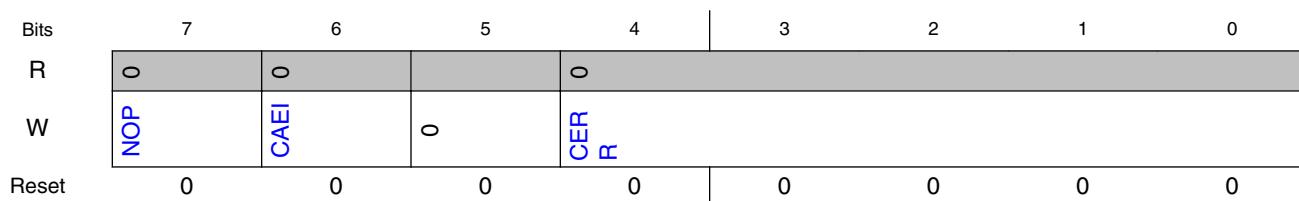

#### 6.5.5.12.1 Offset

Register	Offset
CERR	1Eh

### 6.5.5.12.2 Function

The CERR provides a simple memory-mapped mechanism to write 0 to a given field in the ERR register to disable the error condition field for a given channel. The given value on a register write causes the corresponding field in the ERR register to be written with 0. Writing 1 to the CAEI field provides a global clear to 0 function, forcing the ERR register contents to be written with 0, clearing all channel error indicators. If the NOP field is 1, the command is ignored. This enables you to write multiple-byte registers as a 32-bit word. Reads of this register return all zeroes.

### 6.5.5.12.3 Diagram

### 6.5.5.12.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation; all other fields in this register are ignored.
6 CAEI	Clear All Error Indicators 0b - Write 0 to only the ERR field specified in the CERR field 1b - Write 0 to all fields in ERR
5 —	Reserved
4-0 CERR	Clear Error Indicator Writes 0 to the corresponding field in ERR

### 6.5.5.13 Clear Interrupt Request (CINT)

#### 6.5.5.13.1 Offset

Register	Offset
CINT	1Fh

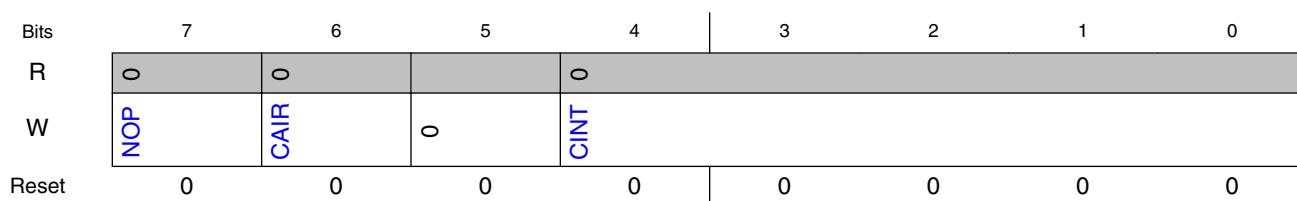

### 6.5.5.13.2 Function

The CINT register provides a simple, memory-mapped mechanism to clear a given field in the INT register to disable the interrupt request for a given channel. The given value on a register write causes the corresponding field in the INT register to be cleared. Setting the CAIR field provides a global clear function, forcing the entire contents of the INT to be cleared, disabling all DMA interrupt requests.

If the NOP field is 1, the command is ignored. This enables you to set a single, byte-wide register with a 32-bit write that does not affect the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP field set to 1 so that these registers are not affected by the write.

Reads of this register return all zeroes.

### 6.5.5.13.3 Diagram

### 6.5.5.13.4 Fields

Field	Function
7 NOP	No Op Enable 0b - Normal operation 1b - No operation; all other fields in this register are ignored.
6 CAIR	Clear All Interrupt Requests 0b - Clear only the INT field specified in the CINT field 1b - Clear all bits in INT
5 —	Reserved
4-0 CINT	Clear Interrupt Request Clears the corresponding field in INT

### 6.5.5.14 Interrupt Request (INT)

### 6.5.5.14.1 Offset

Register	Offset
INT	24h

### 6.5.5.14.2 Function

The INT register provides a bit map for the 32 channels signaling the presence of an interrupt request for each channel. Depending on the appropriate bit setting in the transfer-control descriptors, the eDMA engine generates an interrupt on data transfer completion. The outputs of this register are directly routed to the interrupt controller. During the interrupt-service routine associated with any given channel, it is the software's responsibility to write 0 to the appropriate bit, negating the interrupt request. Typically, a write to the CINT register in the interrupt service routine is used for this purpose.

The state of any given channel's interrupt request is directly affected by writes to this register; it is also affected by writes to the CINT register. On writes to INT, a 1 in any bit position clears the corresponding channel's interrupt request. A 0 in any bit position has no effect on the corresponding channel's current interrupt status. The CINT register is provided so the interrupt request for a single channel can easily be cleared without the need to perform a read-modify-write sequence to the INT register.

1 INT1	Interrupt Request 1 0b - The interrupt request for channel 1 is cleared 1b - The interrupt request for channel 1 is active
0 INT0	Interrupt Request 0 0b - The interrupt request for channel 0 is cleared 1b - The interrupt request for channel 0 is active

## 6.5.5.15 Error (ERR)

### 6.5.5.15.1 Offset

Register	Offset
ERR	2Ch

### 6.5.5.15.2 Function

The ERR register provides a bit map for the 32 channels, signaling the presence of an error for each channel. The eDMA engine signals the occurrence of an error condition by setting the appropriate field in this register. The outputs of this register are enabled by the contents of the EEI register, then logically summed across groups of 16 and 32 channels to form several group error interrupt requests, which are then routed to the interrupt controller. During the execution of the interrupt service routine associated with any DMA errors, it is software's responsibility to reset the appropriate bit to 0, negating the error-interrupt request. Typically, a write to the CERR in the interrupt service routine is used for this purpose. The normal DMA channel completion indicators (setting the TCD DONE field to 1 and the possible generation of an interrupt request) are not affected when an error is detected.

The contents of this register can also be polled because a non-zero value indicates the presence of a channel error regardless of the state of the EEI fields. The state of any given channel's error indicators is affected by writes to this register; it is also affected by writes to the CERR. On writes to the ERR, a 1 in any bit position clears the corresponding channel's error status. A 0 in any bit position has no effect on the corresponding channel's current error status. The CERR is provided so the error indicator for a single channel can easily be reset to 0.

### 6.5.5.16 Hardware Request Status (HRS)

#### 6.5.5.16.1 Offset

Register	Offset
HRS	34h

#### 6.5.5.16.2 Function

The HRS register provides a bit map for the DMA channels, signaling the presence of a hardware request for each channel. The hardware request status bits reflect the current state of the register and qualified (via the ERQ fields) DMA request signals, as seen by the DMA's arbitration logic. This view into the hardware request signals may be used for debug purposes.

#### NOTE

These bits reflect the state of the request as seen by the arbitration logic. Therefore, this status is affected by the ERQ bits.

## Memory map/register definition

Each HRS field for its respective channel is 1 when a hardware request is present on the channel. After the request is completed and channel is free, the HRS field is automatically changed to 0 by hardware.

### 6.5.5.18 Channel Priority (DCHPRI0 - DCHPRI31)

#### 6.5.5.18.1 Offset

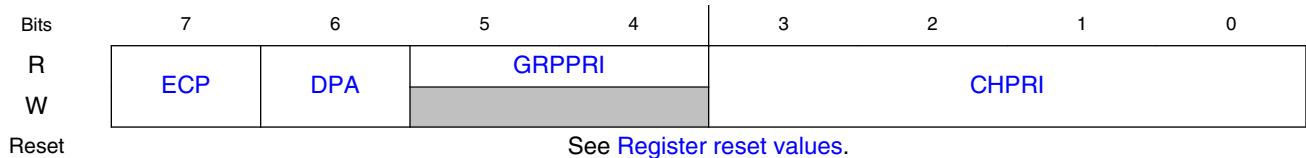

For n = 0 to 31:

Register	Offset
DCHPRIIn	100h + (n + 3 - 2 × (n mod 4))

#### 6.5.5.18.2 Function

When fixed-priority channel arbitration is enabled (CR[ERCA] = 0), the contents of these registers define the unique priorities associated with each channel within a group. The channel priorities are evaluated by numeric value; for example, 0 is the lowest priority, 1 is the next higher priority, then 2, 3, and so on. Software must program the channel priorities with unique values; otherwise, a configuration error is reported. The range of the priority value is limited to the values of 0 through 15. When read, the GRPPRI bits of the DCHPRIIn register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRIIn registers. The group priority is assigned in the DMA control register.

### 6.5.5.18.3 Diagram

DCHPRI30	1Eh
DCHPRI31	1Fh

### 6.5.5.18.5 Fields

Field	Function
7 ECP	Enable Channel Preemption. This field resets to 0. 0b - Channel n cannot be suspended by a higher priority channel's service request 1b - Channel n can be temporarily suspended by the service request of a higher priority channel
6 DPA	Disable Preempt Ability. This field resets to 0. 0b - Channel n can suspend a lower priority channel 1b - Channel n cannot suspend any channel, regardless of channel priority
5-4 GRPPRI	Channel n Current Group Priority Group priority assigned to this channel group when fixed-priority arbitration is enabled. This field is read-only; writes are ignored.
3-0 CHPRI	Channel n Arbitration Priority Channel priority when fixed-priority arbitration is enabled.

### 6.5.5.19 TCD Source Address (TCD0\_SADDR - TCD31\_SADDR)

#### 6.5.5.19.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_SADDR	1000h + (n × 20h)

#### 6.5.5.19.2 Function

This register contains the source address of the transfer.

### 6.5.5.20.3 Fields

Field	Function
15-0	Source address signed offset
SOFF	Sign-extended offset applied to the current source address to form the next-state value as each source read is completed.

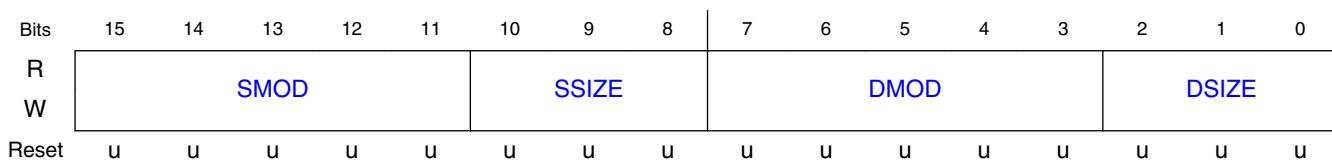

### 6.5.5.21 TCD Transfer Attributes (TCD0\_ATTR - TCD31\_ATTR)

#### 6.5.5.21.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_ATTR	1006h + (n × 20h)

#### 6.5.5.21.2 Diagram

#### 6.5.5.21.3 Fields

Field	Function
15-11 SMOD	Source Address Modulo Any non-zero value in this field defines a specific address range specified to be the value after SADDR + SOFF calculation is performed on the original register value. Setting this field provides the ability to implement a circular data queue easily. For data queues requiring power-of-2 size bytes, the queue should start at a 0-modulo-size address and the SMOD field should be set to the appropriate value for the queue, freezing the desired number of upper address bits. The value programmed into this field specifies the number of lower address bits allowed to change. For a circular queue application, the SOFF is typically set to the transfer size to implement post-increment addressing with the SMOD function constraining the addresses to a 0-modulo-size range. 00000b - Source address modulo feature is disabled 00001-11111b - Value defines address range used to set up circular data queue
10-8 SSIZE	Source data transfer size <b>NOTE:</b> 1. Using a reserved value causes a configuration error. 2. The eDMA defaults to privileged data access for all transactions.

*Table continues on the next page...*

Field	Function
	000b - 8-bit 001b - 16-bit 010b - 32-bit 011b - 64-bit 100b - Reserved 101b - 32-byte burst (4 beats of 64 bits) 110b - Reserved 111b - Reserved
7-3 DMOD	Destination Address Modulo See the SMOD definition.
2-0 DSIZE	Destination data transfer size See the SSIZE definition.

## 6.5.5.22 TCD Minor Byte Count (Minor Loop Mapping Disabled) (TCD0\_NBYTES\_MLNO - TCD31\_NBYTES\_MLNO)

### 6.5.5.22.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_NBYTES_MLNO	1008h + (n × 20h)

### 6.5.5.22.2 Function

This register, or one of the next two registers (TCD\_NBYTES\_MLOFFNO, TCD\_NBYTES\_Mloffyes), that defines the number of bytes to transfer per request. Which register to use depends on whether minor loop mapping is disabled, is enabled but not used for this channel, or is enabled and used.

TCD word 2 is defined as follows if minor loop mapping is disabled ([CR\[EMLM\] = 0](#)).

If minor loop mapping is enabled, see the TCD\_NBYTES\_MLOFFNO and TCD\_NBYTES\_Mloffyes register descriptions for the definition of TCD word 2.

### 6.5.5.22.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

R	NBYTES																
W																	
Reset	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u

### 6.5.5.22.4 Fields

Field	Function
31-0 NBYTES	<p>Minor Byte Transfer Count</p> <p>Number of bytes to be transferred in each service request of the channel. As a channel activates, the appropriate TCD contents load into the eDMA engine, and the appropriate reads and writes are performed until the minor byte transfer count has transferred. This is an indivisible operation and cannot be halted. It can, however, be stalled by using the bandwidth control field, or via preemption.</p> <p>After the minor count is exhausted, the SADDR and DADDR values are written back into the TCD memory, and the major iteration count is decremented and restored to the TCD memory. If the major iteration count is completed, additional processing is performed.</p> <p><b>NOTE:</b> An NBYTES value of 0x0000_0000 is interpreted as a 4 GB transfer.</p>

## 6.5.5.23 TCD Signed Minor Loop Offset (Minor Loop Mapping Enabled and Offset Disabled) (TCD0\_NBYTES\_Mloffno - TCD31\_NBYTES\_Mloffno)

### 6.5.5.23.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_NBYTES_Mloffno	1008h + (n × 20h)

### 6.5.5.23.2 Function

One of three registers (this register, TCD\_NBYTES\_MLNO, or TCD\_NBYTES\_MLOFFYES), that defines the number of bytes to transfer per request. Which register to use depends on whether minor loop mapping is disabled, is enabled but not used for this channel, or is enabled and used.

TCD word 2 is defined as follows if:

- Minor loop mapping is enabled (**CR[EMLM]** = 1) and
- **SMLOE** = 0 and **DMLOE** = 0

If minor loop mapping is enabled and **SMLOE** = 1 or **DMLOE** = 1, refer to the TCD\_NBYTES\_MLOFFYES register description. If minor loop mapping is disabled, refer to the TCD\_NBYTES\_MLNO register description.

### 6.5.5.23.4 Fields

Field	Function
31 SMLOE	Source Minor Loop Offset Enable  Specifies whether the minor loop offset is applied to the source address when the minor loop completes. 0b - The minor loop offset is not applied to the SADDR 1b - The minor loop offset is applied to the SADDR
30 DMLOE	Destination Minor Loop Offset Enable  Specifies whether the minor loop offset is applied to the destination address when the minor loop completes. 0b - The minor loop offset is not applied to the DADDR 1b - The minor loop offset is applied to the DADDR
29-0 NBYTES	Minor Byte Transfer Count  Number of bytes to be transferred in each service request of the channel.

Field	Function
	As a channel activates, the appropriate TCD contents load into the eDMA engine, and the appropriate reads and writes are performed until the minor byte transfer count has transferred. This is an indivisible operation and cannot be halted. It can, however, be stalled by using the bandwidth control field, or via preemption. After the minor count is exhausted, the SADDR and DADDR values are written back into the TCD memory, and the major iteration count is decremented and restored to the TCD memory. If the major iteration count is completed, additional processing is performed.

## 6.5.5.24 TCD Signed Minor Loop Offset (Minor Loop Mapping and Offset Enabled) (TCD0\_NBYTES\_MloffYES - TCD31\_NBYTES\_MloffYES)

### 6.5.5.24.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_NBYTES_Mloff YES	1008h + (n × 20h)

### 6.5.5.24.2 Function

One of three registers (this register, TCD\_NBYTES\_MLNO, or TCD\_NBYTES\_MloffNO), that defines the number of bytes to transfer per request. Which register to use depends on whether minor loop mapping is disabled, is enabled but not used for this channel, or is enabled and used.

TCD word 2 is defined as follows if:

- Minor loop mapping is enabled ([CR\[EMLM\] = 1](#)) and
- Minor loop offset is enabled (SMLOE or DMLOE = 1)

If minor loop mapping is enabled and SMLOE = 0 and DMLOE = 0, refer to the TCD\_NBYTES\_MloffNO register description. If minor loop mapping is disabled, refer to the TCD\_NBYTES\_MLNO register description.

### 6.5.5.24.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	Mloff								NBYTES								
W																	
Reset	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u

### 6.5.5.24.4 Fields

Field	Function
31 SMLOE	Source Minor Loop Offset Enable  Specifies whether the minor loop offset is applied to the source address when the minor loop completes. 0b - The minor loop offset is not applied to the SADDR 1b - The minor loop offset is applied to the SADDR
30 DMLOE	Destination Minor Loop Offset Enable  Specifies whether the minor loop offset is applied to the destination address when the minor loop completes. 0b - The minor loop offset is not applied to the DADDR 1b - The minor loop offset is applied to the DADDR
29-10 Mloff	If SMLOE = 1 or DMLOE = 1, this field represents a sign-extended offset applied to the source or destination address to form the next-state value after the minor loop completes.
9-0 NBYTES	Minor Byte Transfer Count  Number of bytes to be transferred in each service request of the channel.  As a channel activates, the appropriate TCD contents load into the eDMA engine, and the appropriate reads and writes are performed until the minor byte transfer count has transferred. This is an indivisible operation and cannot be halted. It can, however, be stalled by using the bandwidth control field, or via preemption.  After the minor count is exhausted, the SADDR and DADDR values are written back into the TCD memory, and the major iteration count is decremented and restored to the TCD memory. If the major iteration count is completed, additional processing is performed.

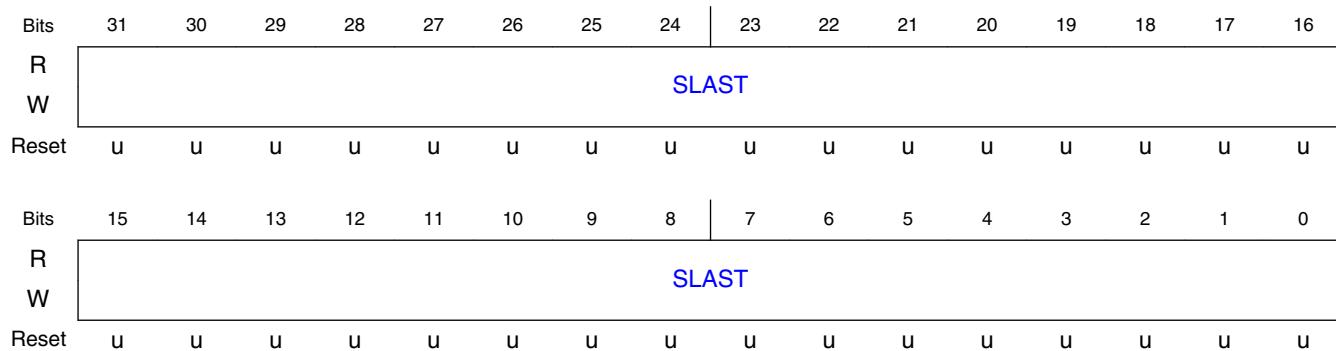

### 6.5.5.25 TCD Last Source Address Adjustment (TCD0\_SLAST - TCD31\_SLAST)

### 6.5.5.25.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_SLAST	100Ch + (n × 20h)

### 6.5.5.25.2 Diagram

### 6.5.5.25.3 Fields

Field	Function
31-0 SLAST	Last Source Address Adjustment  Adjustment value added to the source address at the completion of the major iteration count. This value can be applied to restore the source address to the initial value, or adjust the address to reference the next data structure.  This register uses two's complement notation; the overflow bit is discarded.

## 6.5.5.26 TCD Destination Address (TCD0\_DADDR - TCD31\_DADDR)

### 6.5.5.26.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_DADDR	1010h + (n × 20h)

### 6.5.5.26.2 Function

This register contains the destination address of the transfer.

### 6.5.5.26.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

R	DADDR																
W																	
Reset	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	

### 6.5.5.26.4 Fields

Field	Function
31-0	Destination Address
DADDR	Memory address pointing to the destination data.

## 6.5.5.27 TCD Signed Destination Address Offset (TCD0\_DOFF - TCD31\_DOFF)

### 6.5.5.27.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_DOFF	1014h + (n × 20h)

### 6.5.5.27.2 Diagram

Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	DOFF																
W																	
Reset	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	

### 6.5.5.27.3 Fields

Field	Function
15-0	Destination Address Signed Offset
DOFF	Sign-extended offset applied to the current destination address to form the next-state value as each destination write is completed.

## 6.5.5.28 TCD Current Minor Loop Link, Major Loop Count (Channel Linking Disabled) (TCD0\_CITER\_ELINKNO - TCD31\_CITER\_ELINKNO)

### 6.5.5.28.1 Offset

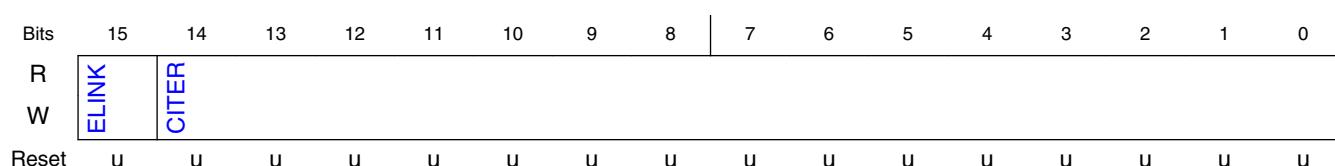

For n = 0 to 31:

Register	Offset
TCDn_CITER_ELINKNO	1016h + (n × 20h)

### 6.5.5.28.2 Function

This register contains the minor-loop channel-linking configuration and the channel's current iteration count. It is the same register as [TCD Current Minor Loop Link, Major Loop Count \(Channel Linking Enabled\) \(TCD0\\_CITER\\_ELINKYES - TCD31\\_CITER\\_ELINKYES\)](#), but its fields are defined differently based on the state of the ELINK field. If the ELINK field is 0, this register is defined as follows.

### 6.5.5.28.3 Diagram

### 6.5.5.28.4 Fields

Field	Function
15 ELINK	<p>Enable channel-to-channel linking on minor-loop complete</p> <p>As the channel completes the minor loop, this field enables linking to another channel, defined by the LINKCH field. The link target channel initiates a channel service request via an internal mechanism that sets TCDn_CSR[START] of the specified channel.</p> <p>If channel linking is disabled, the CITER value is extended to 15 bits in place of a link channel number. If the major loop is exhausted, this link mechanism is suppressed in favor of the MAJORELINK channel linking.</p> <p><b>NOTE:</b> This field must be equal to BITER[ELINK]; otherwise, a configuration error is reported.</p> <ul style="list-style-type: none"> <li>0b - Channel-to-channel linking is disabled</li> <li>1b - Channel-to-channel linking is enabled</li> </ul>
14-0 CITER	<p>Current Major Iteration Count</p> <p>This field is the current major loop count for the channel. It is decremented each time the minor loop is completed and updated in the transfer control descriptor memory. After the major iteration count is exhausted, the channel performs a number of operations, for example, final source and destination address calculations. It optionally generates an interrupt to signal channel completion before reloading the CITER field from the Beginning Iteration Count (BITER) field.</p> <p><b>NOTE:</b></p> <ol style="list-style-type: none"> <li>1. When the CITER field is initially loaded by software, it must be set to the same value as that contained in the BITER field.</li> <li>2. If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.</li> </ol>

### 6.5.5.29 TCD Current Minor Loop Link, Major Loop Count (Channel Linking Enabled) (TCD0\_CITER\_ELINKYES - TCD31\_CITER\_ELINKYES)

#### 6.5.5.29.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_CITER_ELINKYE S	1016h + (n × 20h)

#### 6.5.5.29.2 Function

This register contains the minor-loop channel-linking configuration and the channel's current iteration count. It is the same register as [TCD Current Minor Loop Link, Major Loop Count \(Channel Linking Disabled\) \(TCD0\\_CITER\\_ELINKNO - TCD31\\_CITER\\_ELINKNO\)](#), but its fields are defined differently based on the state of the ELINK field. If the ELINK field is 1, this register is defined as follows.

### 6.5.5.29.3 Diagram

Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	ELINK							CITER									
W		O	LINKCH														
Reset	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u	u

### 6.5.5.29.4 Fields

Field	Function
15 ELINK	<p>Enable channel-to-channel linking on minor-loop complete</p> <p>As the channel completes the minor loop, this field enables linking to another channel, defined by the LINKCH field. The link target channel initiates a channel service request via an internal mechanism that sets TCDn_CSR[START] of the specified channel.</p> <p>If channel linking is disabled, the CITER value is extended to 15 bits in place of a link channel number. If the major loop is exhausted, this link mechanism is suppressed in favor of the MAJORELINK channel linking.</p> <p><b>NOTE:</b> This field must be equal to BITER[ELINK]; otherwise, a configuration error is reported.</p> <ul style="list-style-type: none"> <li>0b - Channel-to-channel linking is disabled</li> <li>1b - Channel-to-channel linking is enabled</li> </ul>
14 —	Reserved
13-9 LINKCH	<p>Minor Loop Link Channel Number</p> <p>If channel-to-channel linking is enabled (ELINK = 1), then after the minor loop is exhausted, the eDMA engine initiates a channel service request to the channel defined by this field, by setting that channel's TCDn_CSR[START].</p>
8-0 CITER	<p>Current Major Iteration Count</p> <p>This field is the current major loop count for the channel. It is decremented each time the minor loop is completed and updated in the transfer control descriptor memory. After the major iteration count is exhausted, the channel performs a number of operations, for example, final source and destination address calculations. It optionally generates an interrupt to signal channel completion before reloading the CITER field from the Beginning Iteration Count (BITER) field.</p> <p><b>NOTE:</b></p> <ol style="list-style-type: none"> <li>1. When the CITER field is initially loaded by software, it must be set to the same value as that contained in the BITER field.</li> <li>2. If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.</li> </ol>

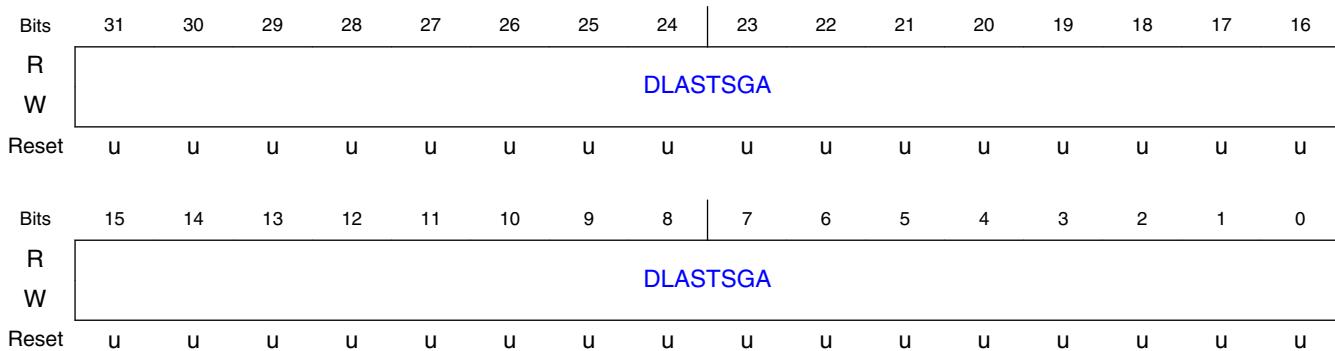

### 6.5.5.30 TCD Last Destination Address Adjustment/Scatter Gather Address (TCD0\_DLASTSGA - TCD31\_DLASTSGA)

### 6.5.5.30.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_DLASTSGA	1018h + (n × 20h)

### 6.5.5.30.2 Diagram

### 6.5.5.30.3 Fields

Field	Function
31-0 DLASTSGA	<p>Destination last address adjustment, or next memory address TCD for channel (scatter/gather)</p> <p>If (TCDn_CSR[ESG] = 0) then:</p> <ul style="list-style-type: none"> <li>This is the adjustment value added to the destination address at the completion of the major iteration count. This value can apply to restore the destination address to the initial value or adjust the address to reference the next data structure.</li> <li>This field uses two's complement notation for the final destination address adjustment.</li> </ul> <p>Otherwise:</p> <ul style="list-style-type: none"> <li>This address points to the beginning of a 0-modulo 32-byte region containing the next TCD to be loaded into this channel. This channel reload is performed as the major iteration count completes. The scatter/gather address must be 0-modulo 32-byte; otherwise a configuration error is reported.</li> </ul>

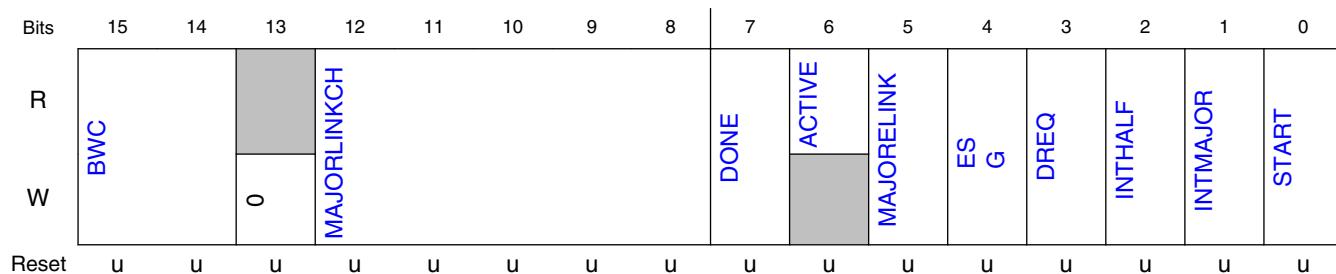

## 6.5.5.31 TCD Control and Status (TCD0\_CSR - TCD31\_CSR)

### 6.5.5.31.1 Offset

For n = 0 to 31:

Register	Offset
TCDn_CSR	101Ch + (n × 20h)

### 6.5.5.31.2 Diagram

### 6.5.5.31.3 Fields

Field	Function
15-14 BWC	<p>Bandwidth Control</p> <p>Throttles the amount of bus bandwidth consumed by the eDMA. Generally, as the eDMA processes the minor loop, it continuously generates read/write sequences until the minor count is exhausted. This field forces the eDMA to stall after the completion of each read/write access to control the bus request bandwidth seen by the crossbar switch.</p> <p><b>NOTE:</b> If the source and destination sizes are equal, this field is ignored between the first and second transfers and after the last write of each minor loop. This behavior is a side effect of reducing start-up latency.</p> <ul style="list-style-type: none"> <li>00b - No eDMA engine stalls</li> <li>01b - Reserved</li> <li>10b - eDMA engine stalls for 4 cycles after each R/W</li> <li>11b - eDMA engine stalls for 8 cycles after each R/W</li> </ul>
13 —	Reserved
12-8 MAJORLINKCH	<p>Major Loop Link Channel Number</p> <p>If (MAJORELINK = 0) then:</p> <ul style="list-style-type: none"> <li>• No channel-to-channel linking, or chaining, is performed after the major loop counter is exhausted.</li> </ul> <p>Otherwise:</p> <ul style="list-style-type: none"> <li>• After the major loop counter is exhausted, the eDMA engine initiates a channel service request at the channel defined by this field by setting that channel's <b>START</b> bit.</li> </ul>
7 DONE	<p>Channel Done</p> <p>This field indicates whether the eDMA has completed the major loop. The eDMA engine sets the value of this field to 1 when the CITER count reaches zero. The value of this field is reset to 0 by the hardware (when the channel is activated) or by software.</p> <p><b>NOTE:</b> This field must be 0 to write the MAJORELINK or ESG fields.</p>
6	Channel Active

Table continues on the next page...

## Memory map/register definition

Field	Function
ACTIVE	This field indicates whether the channel is currently in execution. The eDMA sets the value of this field to 1 when channel service begins, and resets it to 0 as the minor loop completes or when any error condition is detected.
5 MAJORELINK	<p>Enable channel-to-channel linking on major loop complete</p> <p>As the channel completes the major loop, this field controls linking to another channel, defined by MAJORLINKCH. The link target channel initiates a channel service request via an internal mechanism that sets TCDn_CSR[START] of the specified channel.</p> <p><b>NOTE:</b> To support the dynamic linking coherency model, this field is forced to zero when written to when TCDn_CSR[DONE] is set.</p> <ul style="list-style-type: none"> <li>0b - Channel-to-channel linking is disabled</li> <li>1b - Channel-to-channel linking is enabled</li> </ul>
4 ESG	<p>Enable Scatter/Gather Processing</p> <p>As the channel completes the major loop, this field controls scatter/gather processing in the current channel. If enabled, the eDMA engine uses DLASTSGA as a memory pointer to a 0-modulo 32-bit address containing a 32-byte data structure loaded as the TCD into local memory.</p> <p><b>NOTE:</b> To support the dynamic scatter/gather coherency model, this field is forced to zero when written to when TCDn_CSR[DONE] is set.</p> <ul style="list-style-type: none"> <li>0b - The current channel's TCD is normal format</li> <li>1b - The current channel's TCD specifies a scatter gather format</li> </ul>
3 DREQ	<p>Disable Request</p> <p>If the value of this field is 1, eDMA hardware automatically writes 0 to the corresponding ERQ field when the current major iteration count reaches zero.</p> <ul style="list-style-type: none"> <li>0b - The channel's ERQ field is not affected</li> <li>1b - The channel's ERQ field value changes to 0 when the major loop is complete</li> </ul>
2 INTHALF	<p>Enable an interrupt when major counter is half complete.</p> <p>If the value of this field is 1, the channel generates an interrupt request by setting the appropriate field in the INT register when the current major iteration count reaches the halfway point. Specifically, the comparison performed by the eDMA engine is (CITER == (BITER &gt;&gt; 1)). This halfway point interrupt request is provided to support double-buffered, also known as ping-pong, schemes or other types of data movement where the processor needs an early indication of the transfer's progress.</p> <p><b>NOTE:</b> If BITER = 1, do not use INTHALF. Use INTMAJOR instead.</p> <ul style="list-style-type: none"> <li>0b - Half-point interrupt is disabled</li> <li>1b - Half-point interrupt is enabled</li> </ul>
1 INTMAJOR	<p>Enable an interrupt when major iteration count completes.</p> <p>If the value of this field is 1, the channel generates an interrupt request by setting the appropriate field in the INT when the current major iteration count reaches zero.</p> <ul style="list-style-type: none"> <li>0b - End of major loop interrupt is disabled</li> <li>1b - End of major loop interrupt is enabled</li> </ul>
0 START	<p>Channel Start</p> <p>If the value of this field is 1, the channel is requesting service. eDMA hardware automatically writes 0 to this field after the channel begins execution.</p> <ul style="list-style-type: none"> <li>0b - Channel is not explicitly started</li> <li>1b - Channel is explicitly started via a software initiated service request</li> </ul>

### 6.5.5.32 TCD Beginning Minor Loop Link, Major Loop Count (Channel Linking Disabled) (TCD0\_BITER\_ELINKNO - TCD31\_BITER\_ELINKNO)

#### 6.5.5.32.1 Offset

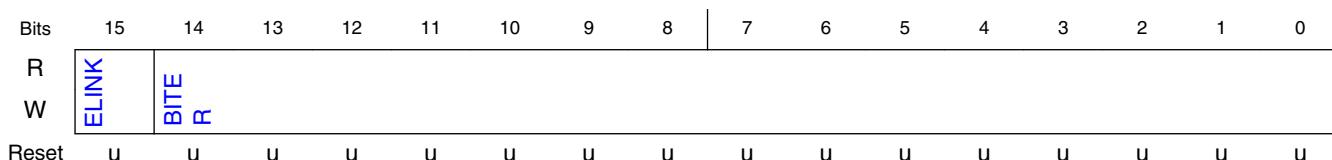

For n = 0 to 31:

Register	Offset
TCDn_BITER_ELINKNO	101Eh + (n × 20h)

#### 6.5.5.32.2 Function

If TCDn\_BITER[ELINK] is 0, the TCDn\_BITER register is defined as follows.

#### 6.5.5.32.3 Diagram

#### 6.5.5.32.4 Fields

Field	Function
15 ELINK	<p>Enables channel-to-channel linking on minor loop complete</p> <p>As the channel completes the minor loop, this field enables linking to another channel, defined by BITER[LINKCH]. The link target channel initiates a channel service request via an internal mechanism that sets TCDn_CSR[START] of the specified channel. If channel linking is disabled, the BITER value extends to 15 bits in place of a link channel number. If the major loop is exhausted, this link mechanism is suppressed in favor of the MAJORELINK channel linking.</p> <p><b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.</p> <p>0b - Channel-to-channel linking is disabled 1b - Channel-to-channel linking is enabled</p>
14-0 BITER	<p>Starting Major Iteration Count</p> <p>As the TCD is first loaded by software, this 9-bit (ELINK = 1) or 15-bit (ELINK = 0) field must be equal to the value in the CITER field. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.</p> <p><b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field. If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.</p>

### 6.5.5.33 TCD Beginning Minor Loop Link, Major Loop Count (Channel Linking Enabled) (TCD0\_BITER\_ELINKYES - TCD31\_BITER\_ELINKYES)

#### 6.5.5.33.1 Offset

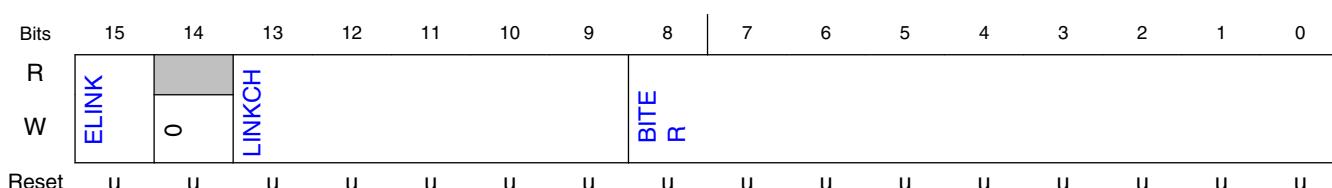

For n = 0 to 31:

Register	Offset
TCDn_BITER_ELINKYE S	101Eh + (n × 20h)

#### 6.5.5.33.2 Function

If TCDn\_BITER[ELINK] is 1, the TCDn\_BITER register is defined as follows.

#### 6.5.5.33.3 Diagram

#### 6.5.5.33.4 Fields

Field	Function
15 ELINK	<p>Enables channel-to-channel linking on minor loop complete</p> <p>As the channel completes the minor loop, this field enables linking to another channel, defined by BITER[LINKCH]. The link target channel initiates a channel service request via an internal mechanism that sets TCDn_CSR[START] of the specified channel. If channel linking disables, the BITER value extends to 15 bits in place of a link channel number. If the major loop is exhausted, this link mechanism is suppressed in favor of the MAJORELINK channel linking.</p> <p><b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.</p> <p>0b - Channel-to-channel linking is disabled 1b - Channel-to-channel linking is enabled</p>
14 —	Reserved

Table continues on the next page...

Field	Function
13-9 LINKCH	<p>Link Channel Number</p> <p>If channel-to-channel linking is enabled (ELINK = 1), then after the minor loop is exhausted, the eDMA engine initiates a channel service request at the channel defined by this field, by setting that channel's TCDn_CSR[START].</p> <p><b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.</p>
8-0 BITER	<p>Starting major iteration count</p> <p>As the TCD is first loaded by software, this 9-bit (ELINK = 1) or 15-bit (ELINK = 0) field must be equal to the value in the CITER field. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.</p> <p><b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field. If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.</p>

# **Chapter 7**

## **System Security**

### **7.1 Chapter overview**

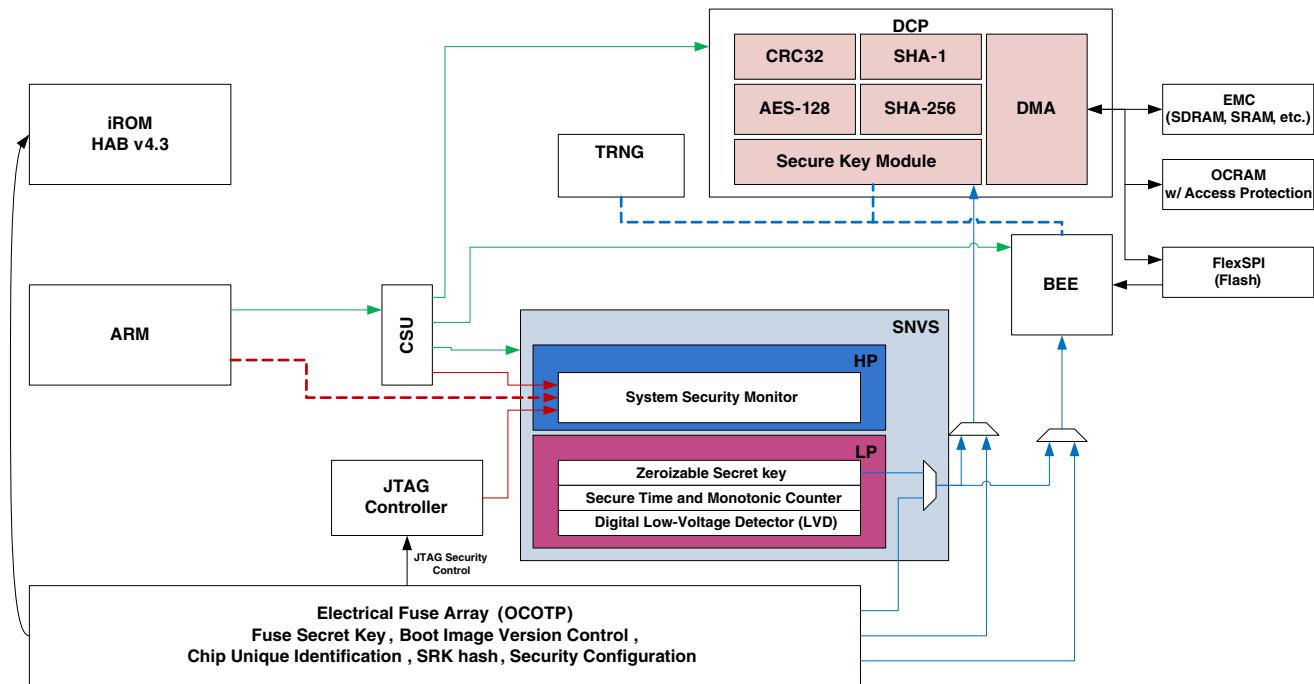

This chapter provides an overview of the following chip security components, explaining the purpose and features of each of them.

- System Boot ROM including High Assurance Boot (HAB)
- Secure Non-Volatile Storage (SNVS) with the security monitor, key storage, and real-time clock
- Data co-processor (DCP) with cryptographic acceleration, hardware encryption, and hash algorithm engine for AES128 and SHA-1/256
- True Random Number Generator (TRNG)
- On-chip One-Time Programmable Element Controller (OCOTP\_CTRL) with on-chip electrical fuse arrays
- Central Security Unit (CSU)
- System JTAG Controller (SJC) with secure debug
- Bus Encryption Engine (BEE) for on-the-fly FlexSPI(QSPI) Flash decryption

The detailed description of each component can be found in the Security Reference Manual for this chip.

### **7.2 Feature summary**

This figure shows a simplified diagram of the security subsystem:

**Figure 7-1. Security subsystem (simplified)**

All platforms built using this chip share a general need for security, though the specific security requirements vary greatly from platform to platform. For example, portable consumer devices need to protect a different type and cost of assets than automotive or industrial platforms. Each market must be protected against different kinds of attacks. The platform designers need an appropriate set of countermeasures to meet the security needs of their specific platform.

To help the platform designers to meet the requirements of each market, the chip incorporates a range of security features. Most of these features provide protection against specific kinds of attack, and can be configured for different levels according to the required degree of protection. These features are designed to work together or independently. They can be also integrated with the appropriate software to create defensive layers. In addition, the chip includes a general-purpose accelerator that enhances the performance of selected industry-standard cryptographic algorithms.

The security features include:

- Secure High-Assurance Boot
  - Security library embedded in the immutable on-chip ROM
  - Authenticated boot, which protects against unauthorized software
    - Verification of the code signature during boot
    - RSA-1024/2048/3072/4096 keys anchored to the OTP fingerprint (SHA-256)
  - Encrypted boot which protects the software confidentiality

- Runs every time the chip is reset
- Image version control/image revocation (on-chip OTP-based)
- Secure storage
  - Off-chip storage protection using AES-128 and the chip's unique hardware-only key
- Hardware cryptographic accelerators
  - Symmetric: AES-128
  - Hash message digest: SHA-1, SHA-256
- Standalone True Random Number Generator (SA-TRNG) to act as entropy generator
- Secure debugging
  - Configurable protection against unauthorized JTAG manipulation
  - Three security levels + a complete JTAG disable
  - Support for JTAG port secure reopening for field return debugging
- Electrical fuses (OTP Memory)
- Hardware bus encryption
  - AES-128 encryption, supporting ECB and CTR modes
  - Non-secured access filtering

## 7.3 High-Assurance Boot (HAB)

The HAB, which is the high-assurance boot feature in the system boot ROM, detects and prevents the execution of unauthorized software (malware) during the boot sequence.

When the unauthorized software is permitted to gain control of the boot sequence, it can be used for a variety of goals, such as exposing stored secrets, circumventing access controls to sensitive data, services, or networks, or for re-purposing the platform. The unauthorized software can enter the platform during upgrades or re-provisioning, or when booting from the USB connections or removable devices.

The HAB protects against unauthorized software by:

- Using digital signatures to recognize the authentic software. This enables you to boot the device to a known initial state and run the software signed by the device manufacturer.
- Using code encryption to protect the confidential software during off-chip storage. When activated, the HAB decrypts the software loaded into the RAM before execution.

### 7.3.1 HAB process flow

The following figure shows the flow for creating and verifying digital signatures. The top half of this figure shows the signing process, which is performed off-chip. The bottom half shows the verification process performed on-chip during every system boot.

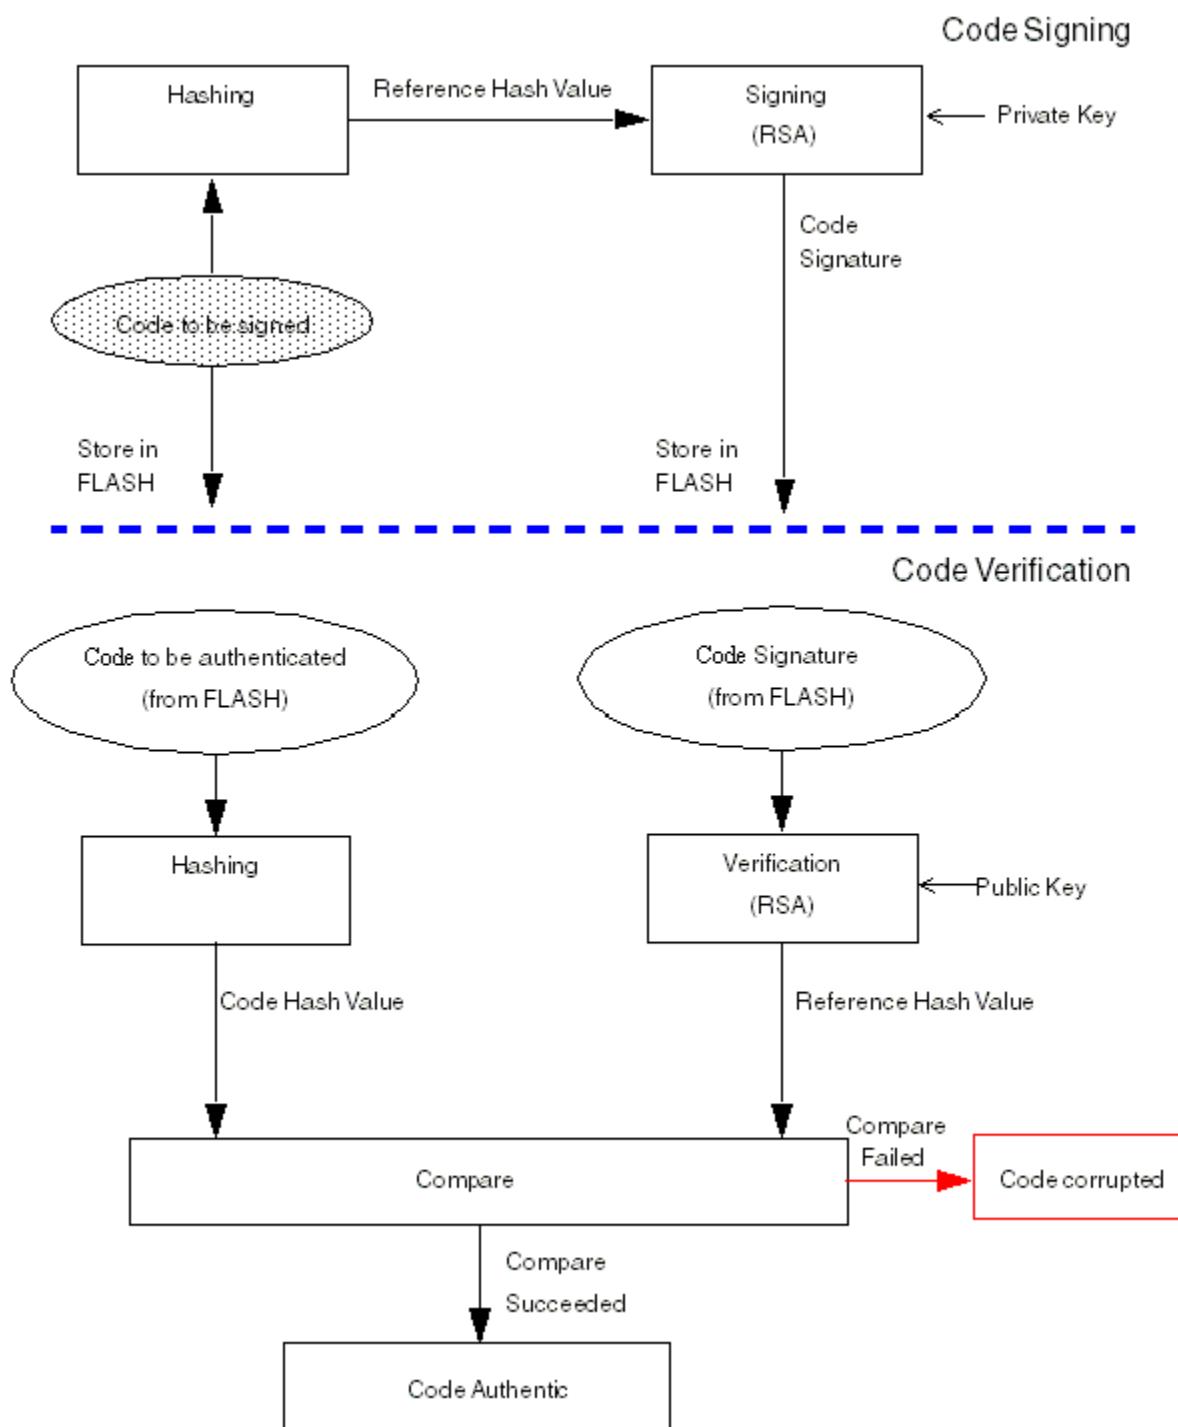

Figure 7-2. Code signing and authentication processes

The original software is programmed into the flash memory (or any other boot device) along with the signature. The HAB uses a public key to recover the reference hash value from the signature; it then compares the reference hash value to the current hash value calculated from the software in the flash. If the contents of the flash are modified either intentionally or unintentionally, the two hash values do not match and the verification fails.

### 7.3.2 HAB feature summary

The HAB features:

- Enforced internal boot via on-chip masked ROM
- Authentication of software loaded from any boot device (including the USB download)
- Authenticated decryption of software loaded from any boot device (including USB download) using the AES keys (128-bit)
- CMS PKCS#1 signature verification using RSA public key (1024, 2048, 3072 or 4096) and the SHA256 hash algorithm
- Public Key Infrastructure (PKI) support using X.509v3 certificates
- Root public key fingerprint in the manufacturer-programmable on-chip fuses
- Multiple root public keys with revocation by fuses
- Initialization of other security components
- Supports fall-through USB downloader if the primary or recovery boot fails
- Open configuration for development purposes and non-secure platforms
- Closed configuration for shipping secure platforms

On the chip, the HAB is integrated with these security features:

- The HAB initializes the SNVS security monitor state machine. A successful secure boot with the HAB is required for the platform software to gain access to use the DCP master secret key selected by SNVS.
- The HAB reads the root public key fingerprint, revocation mask, and security configuration from the OCOTP\_CTRL.
- The HAB initializes the CSU.
- The HAB can use the DCP to accelerate hash calculations.

## 7.4 Secure Non-Volatile Storage (SNVS) module

- Provides a non-volatile real-time clock maintained by a coin-cell battery during system power down for use in both the secure and non-secure platforms.

## Secure Non-Volatile Storage (SNVS) module

- Protects the secure real-time clock against rollback attacks in time-sensitive protocols such as DRM and PKI
- Deters replay attacks in time-independent protocols such as certificate or firmware revocations
- Handles security violation detection and reporting, to defend sensitive data and operations against compromise, both at run-time and during system power-down
- Controls the access to the OTP master secret key used by the DCP to protect confidential data in the off-chip storage
- Provides non-volatile highly protected storage for an alternative master secret key

### 7.4.1 SNVS architecture

The SNVS is partitioned into two sections: a low-power part (SNVS\_LP) and a high-power part (SNVS\_HP).

The SNVS\_LP block is in the always-powered-up domain. It is isolated from the rest of the logic by isolation cells which are library-instantiated cells that insure that the powered-up logic is not corrupted when the power goes down in the rest of the chip.

The SNVS\_LP has these functional units:

- Zeroizable Master Key
- Secure non-rollover real-time counter with alarm
- Non-rollover monotonic counter
- Digital Low-Voltage Detector (LVD)
- General-purpose register
- Control and status registers

The SNVS\_HP is in the chip power-supply domain. The SNVS\_HP provides an interface between the SNVS\_LP and the rest of the system. The access to the SNVS\_LP registers can be gained through the SNVS\_HP only when it is powered up according to the access permission policy.

The SNVS\_HP has these functional units:

- IP bus interface
- SNVS\_LP interface
- System Security Monitor (SSM)
- Zeroizable Master Key programming mechanism
- Master Key control block
- Non-secure real-time counter with alarm
- Control and status registers

## 7.5 Data Co-Processor (DCP)

For security purposes, the Data Co-Processor (DCP) provides hardware acceleration for the cryptographic algorithms. The features of DCP include:

- Encryption Algorithms: AES-128 (ECB and CBC modes)
- Hashing Algorithms: SHA-1 and SHA-256
- CRC-32
- Key selection from the SNVS, DCP internal key storage, or general memory
- Internal Memory for storing up to four AES-128 keys—when a key is written to a key slot it can be read only by the DCP AES-128 engine
- IP slave interface
- DMA

## 7.6 Standalone True Random Number Generator (TRNG)

The SA-TRNG is hardware accelerator module that generates a 512-bit entropy as needed by an entropy consuming module or by other post processing functions. A typical entropy consumer is a pseudo random number generator (PRNG) which can be implemented to achieve both true randomness and cryptographic strength random numbers using the SA-TRNG output as its entropy seed. The PRNG is not part of this module.

## 7.7 On-Chip OTP Controller (OCOTP\_CTRL)

The OCOTP\_CTRL provides the primary user-visible mechanism for interfacing with the on-chip fuses. These fuses' uses include:

- Unique chip identifiers
- Mask revision numbers
- Cryptographic keys
- Security configuration
- Boot characteristics
- Various control signals requiring permanent non-volatility

The OCOTP\_CTRL provides:

- Shadow cache of fuse values, loaded at reset, before the system boot
- Ability to read and override the fuse values in the shadow cache (does not affect the fuse element)

## Central Security Unit (CSU)

- Ability to read the fuses directly (ignoring the shadow cache)
- Ability to write (program) the fuses by software or JTAG
- Fuses and shadow cache bits enforce read-protect, override-protect, and write-protect
- Lock fuses for selected fuse fields
- Scan protection
- Volatile software-accessible signals which can be used for software control of hardware elements (not requiring non-volatility).

## 7.8 Central Security Unit (CSU)

Central Security Unit (CSU) sets access control policies between the bus masters and bus slaves, enabling the peripherals to be separated into distinct security domains. This protects against the indirect unauthorized access to data which occurs when the software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring the DMA bus master privileges in the CSU consistently with the software privileges defends against such indirect unauthorized access.

The CSU provides:

- Configuration of peripheral access permissions for peripherals that are unable to control their own access permissions
- Configuration of bus master privileges for bus masters that are unable to control their own privileges
- Optional locking of the individual CSU settings until the next power-on reset

## 7.9 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the Arm processor and the system bus. This enables program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. The System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to the IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary-scan) testing.

The SJC provides these security levels:

- The JTAG Disabled-JTAG use is permanently blocked.
- The No-Debug-All security sensitive JTAG features are permanently blocked.
- The Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- The JTAG Enabled-JTAG use is unrestricted.

The security levels are selected via the eFuse configuration.

### 7.9.1 Scan protection

The chip includes further scan protection logic for those SJC modes where the JTAG use is allowed. This ensures that the access to critical security values is protected as follows:

- The chip is reset when entering the scan mode.
- All modules are reset two clock cycles before receiving the scan-enable indication.
- The chip cannot exit the scan mode without a reset.
- The security modules (including SNVS, CSU, and OCOTP\_CTRL) have an additional scan-protection logic to protect the sensitive internal data and functionality.

See the "System JTAG Controller (SJC)" chapter in the Security Reference Manual for more information on the SJC.

## 7.10 Bus Encryption Engine (BEE)

The Bus Encryption Engine (BEE) is implemented as an on-the-fly decryption engine, which is used for decrypting cypher context of FlexSPI. The main features of the BEE are:

- Standard AXI interconnection
- On-the-fly AES-128 decryption, supporting ECB and CTR modes
- Aliased memory space support. Address remapping for up to two individual regions
- Independent AES Key management for those two individual regions
- Bus access pattern optimization with the aid of the local store and forward buffer
- Non-secured access filtering based on the security label of the access
- Illegal access check and filtering

See the "Bus Encryption Engine (BEE)" chapter in the Security Reference Manual for more information on BEE.

# **Chapter 8**

## **System Debug**

### **8.1 Overview**

This section describes the hardware and software debug and application development features and resources of the chip. It describes the following:

- Core/platform-specific resources
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- Arm Cortex M7 debug and trace components, adapted to SoC (for core debug)
- JTAG port used to interact with core under the debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the Arm RealView Debugging tools and other third-party tools
- TPIU, a trace port interface unit that efficiently accesses the program trace information from the system

### **8.2 Chip and Arm Platform Debug Architecture**

The Arm Debug architecture is based on the Cortex M7 debug and trace components by Arm.

Its architecture maintains the traditional requirements of debug and trace:

- To access the debug functionality without software interaction
- To connect to a running system without performing a reset

Full access to the processor debug capability is available by the Arm debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state, and restarts the processor core.

## 8.2.1 Debug Features

- EmbeddedICE-RT logic
  - Support for both the monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core-mapped and memory-mapped resource examination/modification
- Data communication channel between the Arm core and the host debugger via JTAG or SWD and the Debug Access Port (DAP) module

## 8.2.2 Debug system components

The Arm Cortex M7 debug and trace components include:

- Cortex-M7 DAP (CM7DAP)
- ETM (Embedded Trace Macrocell) supporting instruction trace
- ITM (Instrumentation Trace Macrocell)
- Cortex-M7 TPIU (Trace Port Interface)
- Cross Triggering logic for event routing (CTIs)
- Timestamp Generator (TSGEN)

Other related IPs and functionality:

- Flash Patch and Breakpoint unit (FPB)

### 8.2.2.1 Cortex-M7 DAP (CM7DAP)

The Cortex-M7 DAP (CM7DAP) is a component that provides an interface to allow off-chip debug tools to access the Cortex-M7 processor. It is a low gate-count DAP implementation. The key features of the CM7DAP are:

- Supports JTAG and Serial Wire Debug (SWD) Data Link protocols. Protocol is selected by fuse at reset

- Includes an AHB-AP, intended to be directly connected to the Cortex-M7 processor AHBD slave port
- Implements the Minimal Debug Port programmers model, see the ARM® Debug Interface Architecture Specification ADIv5.0 to ADIv5.2

For more information, see Arm Cortex M7 Integration and Implementation Manual.

### 8.2.2.2 Cortex-M7 Trace Port Interface (TPIU)

The Cortex-M7 TPIU is a component that bridges between the on-chip trace data from the Embedded Trace Macrocell (ETM) and the Instrumentation Trace Macrocell (ITM), with separate IDs, to a data stream. The Cortex-M7 TPIU encapsulates IDs where required, and the data stream is then captured by an external Trace Port Analyzer (TPA).

The Cortex-M7 TPIU is a variant of the CoreSight SoC-400 TPIU that is specially designed for low-cost debug.

The output of the TPIU is connected via external pins (MPS of TRACEDATA (ARM\_TRACEEn), which can be 1, 2, or 4 bits). The corresponding IOMUXC need be configured to select ARM\_TRACEEn function first. The TPIU port size will be updated automatically according to the number of ARM\_TRACEEn selected by IOMUXC. The system may utilize double data rate pins to either use a lower clock speed than that of the 32-bit ATB interface, or use fewer than 4 data pins for the output, based on the ability of the technology used. Given the speed of the ATB, 4 data pins with double data rate is recommended, with the external interface running at half the speed of the ATB. The speed of the external interface is from TRACECLKIN (TRACE\_CLK\_ROOT). TRACECLK (ARM\_TRACE\_CLK) is equal to TRACECLKIN/2, and is divided in the TPIU to clock trace data at the trace capture unit.

For more information, see Arm Cortex M7 Integration and Implementation Manual.

### 8.2.2.3 Embedded Trace Macrocell (ETM)

Instruction trace, also known as ETM (Embedded Trace Macrocell) trace, is a continuously collected sequence of every executed instruction for a selected portion of the application. ETM generates trace packets and sends them to the trace bus. ETM does not actually output every address or instruction that the processor has reached or executed; it usually generates compressed information about the program flow and

outputs full addresses only if needed (for example, if a branch has taken place). Because the debugger knows the application code image, the debugger can then reconstruct the full instruction sequence from the trace data.

For more information about ETM, refer to *Arm® CoreSight™ ETM-M7 Revision r0p1 Technical Reference Manual*.

### 8.2.2.4 Instrumentation Trace Macrocell

The ITM (Instrumentation Trace Macrocell) generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

- Synchronization: DWT provides periodic requests to make ITM generate synchronization packet. Trace capture hardware uses it to identify the alignment of packet bytes in the bit-stream.
- Software Trace: Application software can write console messages directly to ITM stimulus ports, and output them to the host as trace packets.
- Hardware trace: The DWT generates these packets, and the ITM outputs them.
- Timestamping: ITM can generate timestamp packets that are inserted in to the trace stream, to help the host debugger to find out the timing of events. Timestamps are generated relative to packets. The ITM receives a 64-bit counter to generate the timestamp.

Trace data from ITM will be forwarded to TPIU and streamed out via the trace port.

For more information about ITM, refer to *Armv7-M Architecture Reference Manual*.

### 8.2.2.5 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by Arm. A brief description of the CTI is provided below.

The CTI enables the debug logic and ETM to interact with each other. The tables below show how the CTI triggers are connected to the processor and ETM. For more information, refer to Arm Cortex-M7 Processor Revision r1p2 Technical Reference Manual.

**Table 8-1. Trigger Signals to CTI**

Signal	Description	Connection	Acknowledge, handshake
CTITRIGIN[7]	ETM Event Output 3	ETM to CTI	Pulsed
CTITRIGIN[6]	ETM Event Output 2		
CTITRIGIN[5]	ETM Event Output 1		
CTITRIGIN[4]	ETM Event Output 0		
CTITRIGIN[3]	DWT Comparator Output 2	Processor to CTI	
CTITRIGIN[2]	DWT Comparator Output 1		
CTITRIGIN[1]	DWT Comparator Output 0		
CTITRIGIN[0]	Processor Halted		

**Table 8-2. Trigger Signals from CTI**

Signal	Description	Connection	Acknowledge, handshake
CTITRIGOUT[7]	Processor Restart	CTI to Processor	Processor Restarted
CTITRIGOUT[6]	ETM Event Input 3	CTI to ETM	Pulsed
CTITRIGOUT[5]	ETM Event Input 2		
CTITRIGOUT[4]	ETM Event Input 1		
CTITRIGOUT[3]	ETM Event Input 0		
CTITRIGOUT[2]	Interrupt Request 1	CTI to System	Acknowledged by writing to the CTINTACK register in ISR
CTITRIGOUT[1]	Interrupt Request 0		
CTITRIGOUT[0]	Processor Debug Request	CTI to Processor	Acknowledged by the debugger writing to the CTINTACK register

### 8.2.2.6 Timestamp Generator (TSGEN)

The timestamp generator generates the timestamp value that is distributed over the rest of the timestamp interconnect. For this chip the timestamp value is distributed to ITM and ETM. The pselread APB interface is disabled in this chip so the registers in PSELREAD region are not applicable.

For more information about TSGEN, refer to Arm CoreSight SoC-400 Revision: r3p2 Technical Reference Manual

## 8.2.3 Chip-Specific SJC Features

### NOTE

The application note [AN12419: Secure JTAG for i.MXRT10xx](#) describes how the Secure JTAG on the i.MX RT10xx MCU family can be used.

### 8.2.3.1 JTAG Disable Mode

In addition to different JTAG security modes that are implemented internally in the JTAG Controller, there is an option to disable the SJC functionality by e-fuse configuration. This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled.

Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

### 8.2.3.2 JTAG ID

**Table 8-3. i.MX JTAG ID**

Device	Silicon revision	JTAG ID
i.MX RT1060	Rev 1.0	088C_501Dh

### 8.2.3.3 JTAG-to-SWD change sequence

1. Send more than 50 TCK cycles with TMS (SWD\_IO) = 1
2. Send the 16-bit sequence on TMS (SWD\_IO) = 0111\_1001\_1110\_1111 (MSB transmitted first)
3. Send more than 50 TCK cycles with TMS (SWD\_IO) = 1

### NOTE

See the ARM documentation for the CoreSight DAP Lite for restrictions.

## 8.2.4 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- levels of security, ranging from no security to no JTAG accessibility to the chip

### NOTE

The security levels are detailed in the Security Reference Manual (SRM).

## 8.2.5 TAP port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

## 8.2.6 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug\_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
  - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
  - Optional: "ID\_CODE" (SOC JTAG ID register), "HIGHZ"
- The ExtraDebug registers, which implement a variety of control and status features
  - Three 32-bit insecure general purpose status registers
  - Two 32-bit secure status registers - one predefined, one general purpose.
  - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined control and status functions are supported by the SJC.

## 8.3 Miscellaneous

The Miscellaneous function described in this section provide useful general capabilities.

### 8.3.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on.

The debug components can receive resets from the following sources:

- Debug Reset (CDBGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

# Chapter 9

## System Boot

### 9.1 Chip-specific Boot Information

This device has various peripherals supported by the ROM bootloader.

**Table 9-1. ROM Bootloader Peripheral PinMux**

Peripheral	Instance	Port (IO function)	PAD	Mode	Use
LPUART	1	LPUART1_TX	GPIO_AD_B0_12 <span style="color:red">pin 24</span>	ALT2	Can be used for serial downloader mode. Refer to <a href="#">Serial Downloader</a> for more information.
		LPUART1_RX	GPIO_AD_B0_13 <span style="color:red">pin 25</span>	ALT2	
LPSPI	1	LPSPI1_SCK	GPIO_SD_B0_00	ALT4	Serial NOR/EEPROM connected to one of the LPSPI ports can be used as a recovery device. Refer to <a href="#">Recovery devices</a> for more information.  <b>Note:</b> recovery device boot is disabled by default. Fuses must be blown to enable and configure this option.

Table continues on the next page...

**Table 9-1. ROM Bootloader Peripheral PinMux (continued)**

Peripheral	Instance	Port (IO function)	PAD	Mode	Use
		FLEXSPI_A_DATA0	GPIO_SD_B1_08	ALT1	
		FLEXSPI_A_DATA1	GPIO_SD_B1_09	ALT1	
		FLEXSPI_A_DATA2	GPIO_SD_B1_10	ALT1	
		FLEXSPI_A_DATA3	GPIO_SD_B1_11	ALT1	
FlexSPI RESET		GPIO1_IO29	GPIO_AD_B1_13	pin 39 (T9.1)	

**NOTE**

ROM does not support boot from FLEXSPI\_B port directly. ROM always seeks a valid Flash Configuration Block from the FLEXSPI\_A port and then re-configures the FLEXSPI controller using the valid parameters in the block read-out. This reconfiguration can include, but is not limited to, FLEXSPI\_B port support.

## 9.2 Overview

The boot process begins at any Reset where the hardware reset logic forces the Arm core to begin execution starting from the on-chip boot ROM.

The boot ROM code uses the state of the internal register BOOT\_MODE[1:0] as well as the state of various eFuses and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USBOTG and UART)
- Device Configuration Data (DCD) and plugin
- Digital signature and encryption based High-Assurance Boot (HAB)
- Wake-up from the low-power modes
- Encrypted execute-in-place (XIP) on Serial NOR via FlexSPI interface powered by:
  - Bus Encryption Engine (BEE)
  - Data Co-Processor (DCP)

The boot ROM supports boot device as below:

- Serial NOR Flash via FlexSPI
- Serial NAND Flash via FlexSPI
- Parallel NOR Flash via SEMC
- RAWNAND Flash via SEMC

- SD/MMC via uSDHC
- SPI NOR/EEPROM via LPSPI

The boot ROM uses the state of the BOOT\_MODE and eFuses to determine the boot device. For development purposes, the eFuses used to determine the boot device may be overridden using the GPIO pin inputs.

The boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provide a boot device with a new image. Typically, the provisioning program is downloaded to the internal RAM and allows to program the boot devices, such as the FlexSPI NOR flash. The ROM serial downloader uses a high-speed USB in a non-stream mode connection.

The boot ROM allows waking up from the low-power modes. On reset, the ROM checks the power gating status register. When waking from the low-power mode, the core skips loading an image from the boot device and jumps to the address saved in PERSISTENT\_ENTRY0.

The Device Configuration Data (DCD) feature allows the boot ROM code to obtain the SOC configuration data from an external program image residing on the boot device. As an example, the DCD can be used to program the SDRAM controller for optimal settings improving the boot performance. The DCD is restricted to the memory areas and peripheral addresses that are considered essential for the boot purposes (see [Write data command](#)).

A key feature of the boot ROM is the ability to perform a secure boot, also known as a High-Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. The HAB uses a combination of hardware and software together with the Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized program images. Before the HAB allows the user image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as a part of the final program image. If configured to do so, the ROM verifies the signatures using the public keys included in the program image. In addition to supporting the digital signature verification to authenticate the program images, encrypted boot is also supported. The encrypted boot can be used to prevent the cloning of the program image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the serial downloader. The HAB library in the boot ROM also provides the API functions, allowing the additional boot chain components (e.g., bootloader, application) to extend the secure boot chain. The out-of-fab setting for the SEC\_CONFIG is the open configuration, in which the ROM/HAB performs the image authentication, but all authentication errors are ignored and the image is still allowed to execute.

## 9.3 Boot modes

During reset, the chip checks the power gating controller status register.

During boot, the ROM's behavior is defined by the boot mode pin settings, as described in [Boot mode pin settings](#). When waking up from the low-power boot mode, the core skips the clock settings. The boot ROM checks that the PERSISTENT\_ENTRY0 (see [Persistent bits](#)) is a pointer to a valid address space (OCRAM). If the PERSISTENT\_ENTRY0 is a pointer to a valid range, it starts the execution using the entry point from the PERSISTENT\_ENTRY0 register. If the PERSISTENT\_ENTRY0 is a pointer to an invalid range, the core performs the system reset.

### 9.3.1 Boot mode pin settings

The device has four boot modes (one is reserved for NXP use). The boot mode is selected based on the binary value stored in the internal BOOT\_MODE register.

The BOOT\_MODE register is initialized by sampling the BOOT\_MODE0 and BOOT\_MODE1 inputs on the rising edge of the POR\_B. After these inputs are sampled, their subsequent state does not affect the contents of the internal BOOT\_MODE register. The state of the internal BOOT\_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC\_SBMR2). The available boot modes are: Boot From Fuses, Serial Downloader, and Internal Boot. See this table for settings:

**Table 9-2. Boot MODE pin settings**

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

### 9.3.2 High-level boot sequence

The figure found here show the high-level boot ROM code flow.

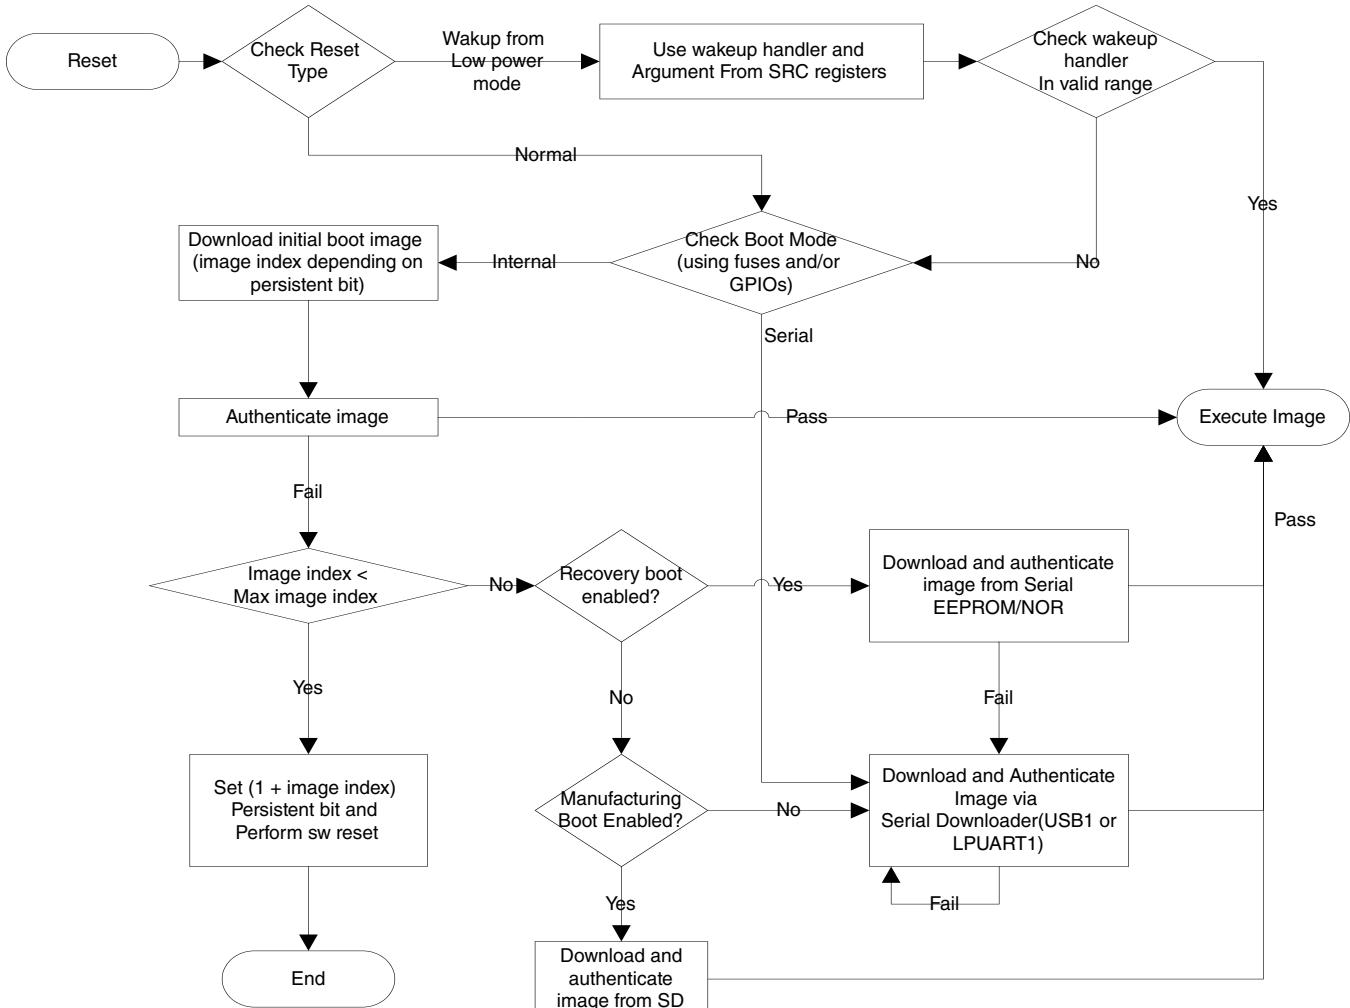

Figure 9-1. Boot flow

### 9.3.3 Boot From Fuses mode (BOOT\_MODE[1:0] = 00b)

A value of 00b in the BOOT\_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot mode \(BOOT\\_MODE\[1:0\] = 10b\)](#) with one difference. In this mode, the override from the GPIO boot pins are ignored. The boot ROM code uses the boot eFuse settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT\_FUSE\_SEL eFuse value. If BT\_FUSE\_SEL = 0, indicating that the boot device (for example, flash) was not programmed yet, the boot flow jumps directly to the Serial Downloader. If BT\_FUSE\_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device. **BT\_FUSE\_SEL = 1 is programmed on every Teensy board**

The first time a board is used, the default eFuses may be configured incorrectly for the hardware on the platform. In such case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using the Boot From Fuses mode addresses this problem.

Setting the BT\_FUSE\_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a program image and blow the BT\_FUSE\_SEL and the other boot configuration eFuses. After the reset, the boot ROM code determines that the BT\_FUSE\_SEL is blown (BT\_FUSE\_SEL = 1) and the ROM code performs an internal boot according to the new eFUSE settings. This allows the user to set BOOT\_MODE[1:0]=00b on a production device and burn the fuses on the same device (by forcing the entry to the Serial Downloader), without changing the value of the BOOT\_MODE[1:0] or the pullups/pulldowns on the BOOT\_MODE pins.

### 9.3.4 Serial Downloader (BOOT\_MODE[1:0] = 01b)

The Serial Downloader provides a means to download a Program Image to the on-chip RAM over USB or UART serial connection. In this mode, typically a host PC can communicate to the ROM bootloader using serial download protocol. Serial downloader and the protocol are discussed in [Serial Downloader](#).

### 9.3.5 Internal Boot mode (BOOT\_MODE[1:0] = 10b)

A value of 10b in the BOOT\_MODE[1:0] register selects the Internal Boot mode. In this mode, the processor continues to execute the boot code from the internal boot ROM.

The boot code performs the hardware initialization, loads the program image from the chosen boot device, performs the image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the program image. If an error occurs during the internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader \(BOOT\\_MODE\[1:0\] = 01b\)](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to the Internal Boot, the boot flow may be controlled by a combination of eFuse settings with an option of overriding the fuse settings using the General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT\_FUSE\_SEL) determines whether the ROM uses the GPIO pins for a selected number of configuration parameters or eFuses in this mode.

BT\_FUSE\_SEL = 1 is programmed on every Teensy board

- If BT\_FUSE\_SEL = 1, all boot options are controlled by the eFuses described in [Boot eFuse descriptions](#).
- If BT\_FUSE\_SEL = 0, the specific boot configuration parameters may be set using the GPIO pins rather than eFuses. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Boot eFuse descriptions](#). [GPIO boot overrides](#) provides the details of the GPIO pins.

The use of the GPIO overrides is intended for development since these pads are used for other purposes in the deployed products. NXP recommends controlling the boot configuration by the eFuses in the deployed products and reserving the use of the GPIO mode for the development and testing purposes only.

### 9.3.6 Boot security settings

The internal boot modes use one of three security configurations.

- Closed: This level is intended for use with shipping-secure products. All HAB functions are executed and the security hardware is initialized (the Security Controller or SNVS enters the Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, and the boot flow is aborted with the control being passed to the serial downloader. At this level, the execution does not leave the internal ROM unless the target executable image is authenticated.
- Open: This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed in the same way as for a closed system. The security hardware is initialized (except for the SNVS which is left in the Non-Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, but have no influence on the boot flow which continues as if the errors did not occur. This configuration is useful for a secure product development because the program image runs even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of the authentication failure.
- Field Return: This level is intended for the parts returned from the shipped products.

## 9.4 Device configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes the boot device selection (FlexSPI NOR FlexSPI NAND, Parallel NOR, SD, MMC, and so on), boot device configuration (SD bus width, speed, and so on), and other. In general, the source for this configuration comes from the eFuses embedded inside the chip. However, certain configuration parameters can be sourced from the GPIO pins, allowing further flexibility during the development process.

### 9.4.1 Boot eFuse descriptions

This table is a comprehensive list of the configuration parameters that the ROM uses.

**Table 9-3. Boot eFuse descriptions**

Fuse	Config uratio n	Definition	GPIO <sup>1</sup>	Shipped value	Settings <sup>2</sup>
BT_FUSE_SEL	OEM	In the Internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by the GPIO pins or the eFuse settings in the On-Chip OTP Controller (OCOTP).  In the Boot From Fuse mode BOOT_MODE[1:0] = 00, the BT_FUSE_SEL fuse indicates whether the bit configuration eFuses are programmed.  <i>BT_FUSE_SEL = 1 is programmed on every Teensy board</i>	NA	0	If BOOT_MODE[1:0] = 10b: <ul style="list-style-type: none"><li>0 - The bits of the SBMR are overridden by the GPIO pins.</li><li>1 - The specific bits of the SBMR are controlled by the eFuse settings.</li></ul> If BOOT_MODE[1:0] = 00b: <ul style="list-style-type: none"><li>0—The BOOT configuration eFuses are not programmed yet. The boot flow jumps to the serial downloader.</li><li>1—The BOOT configuration eFuses are programmed. The regular boot flow is performed.</li></ul>
FIELD_RETURN	OEM	Enables the NXP reserved modes.			0—The NXP reserved modes are disabled. 1—The NXP reserved modes are enabled.
UNIQUE_ID[63:0]	NXP	Device Unique ID, 64-bit UID	NA	Unique ID	Settings vary—used by HAB
BOOT_CFG1[7:0]	OEM	Boot configuration 1	Yes	0	Specific to the selected boot mode
BOOT_CFG2[2:0]	OEM	Boot configuration 2	Yes	0	Specific to the selected boot mode
LPB_BOOT	OEM	Low-Power Boot	No	0	Divide (Core / Bus) based on Boot frequencies: 00 - Div by 1

*Table continues on the next page...*

**Table 9-3. Boot eFuse descriptions (continued)**

Fuse	Configuratio n	Definition	GPIO <sup>1</sup>	Shipped value	Settings <sup>2</sup>
					01 - Div by 2 10 - Div by 4 11 - Div by 8
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	WDOG1 enable: 0—The watchdog reset counter is disabled during the serial downloader. 1—The watchdog reset counter is enabled during the serial downloader.
PAD_SETTINGS	OEM	Override values for the SD/MMC and NAND boot modes	No	0	Override these IO PAD settings: <ul style="list-style-type: none"><li>• PAD_SETTINGS[0]—Slew Rate</li><li>• PAD_SETTINGS[3:1]—Drive Strength</li><li>• PAD_SETTINGS[5:4]—Speed Settings</li></ul>

1. This setting is overridden by the GPIO settings when the BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse

## 9.4.2 GPIO boot overrides

This table provides a list of the GPIO boot overrides:

BOOT\_CFG1 and BOOT\_CFG2 pins are not used with Teensy because BT\_FUSE\_SEL = 1 is programmed

**Table 9-4. GPIO Boot Overrides**

Package Pin	Direction on reset	eFuse
GPIO_AD_B0_04/BOOT_MODE0	Input	Boot Mode selection
GPIO_AD_B0_05/BOOT_MODE1	Input	
GPIO_B0_04	Input	BOOT_CFG1[0]
GPIO_B0_05	Input	BOOT_CFG1[1]
GPIO_B0_06	Input	BOOT_CFG1[2]
GPIO_B0_07	Input	BOOT_CFG1[3]
GPIO_B0_08	Input	BOOT_CFG1[4]
GPIO_B0_09	Input	BOOT_CFG1[5]
GPIO_B0_10	Input	BOOT_CFG1[6]
GPIO_B0_11	Input	BOOT_CFG1[7]
GPIO_B0_12	Input	BOOT_CFG2[0]
GPIO_B0_13	Input	BOOT_CFG2[1]
GPIO_B0_14	Input	BOOT_CFG2[2]

Table continues on the next page...

**Table 9-4. GPIO Boot Overrides (continued)**

Package Pin	Direction on reset	eFuse
GPIO_B0_15	Input	BOOT_CFG2[3]

**NOTE**

Refer to the Fusemap chapter for more information on fuses mapped to the GPIO pins.

The input pins above are sampled at boot, and can be used to override the corresponding eFuse values, depending on the setting of the BT\_FUSE\_SEL fuse.

BT\_FUSE\_SEL = 1 is programmed on every Teensy board.  
These pins do not override eFuse values during boot.

### 9.4.3 Device Configuration Data (DCD)

The DCD is the configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on DCD.

## 9.5 Device initialization

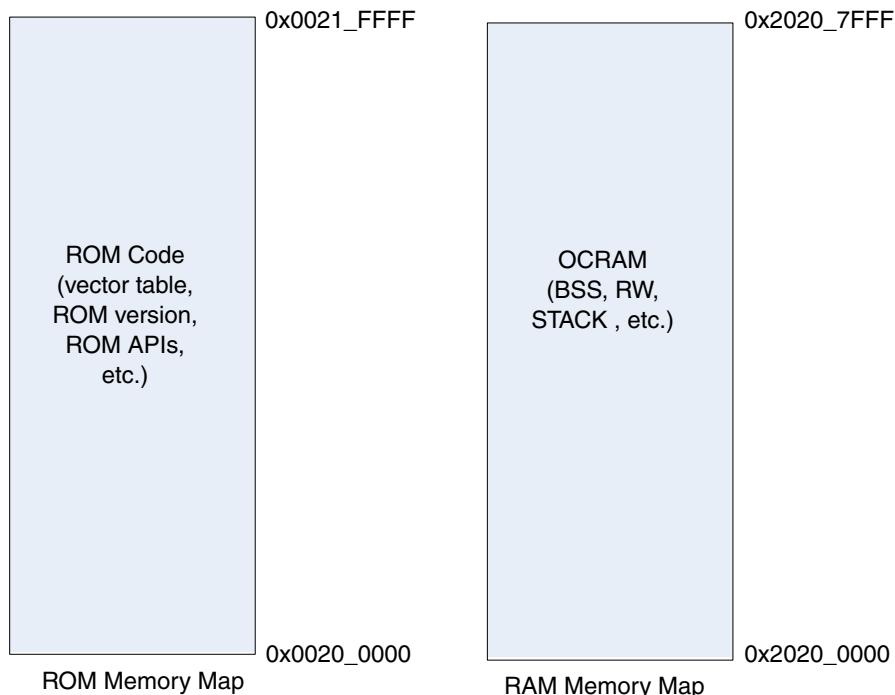

This section describes the details of the ROM and provides the initialization details.

This includes details on:

- The ROM memory map
- The RAM memory map
- On-chip blocks that the ROM must use or change the POR register default values
- Clock initialization
- Enabling the L1 I/D cache
- Exception handling and interrupt handling

### 9.5.1 Internal ROM/RAM memory map

These figures show the internal ROM and RAM memory map:

**Figure 9-2. Internal ROM and RAM memory map****NOTE**

The RAM space occupied by ROM cannot be used as part of the boot image. The entire OCRAM region can be used freely after the boot. The above OCRAM region must be reserved if the user application needs to call the HAB API for image authentication.

### 9.5.2 Boot block activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in an alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and the boot device selection:

Block	Description
CCM	Clock Control Module
FlexSPI	Flexible SPI Interface which supports serial NOR, Serial NAND and serial RAM devices
OCOTP	On Chip One Time Programmable Controller containing the eFuses

*Table continues on the next page...*

Block	Description
IOMUXC	I/O Multiplexer Control which allows the GPIO use to override the eFuse boot settings
IOMUX GPR	I/O Multiplexer control General Purpose Registers
LPSPI	Low Power SPI interface which supports serial NOR/EEPROM devices
SEMC	Smart External Memory Controller which supports parallel NOR and RAWNAND (SLC) devices
SNVS	Secure Non-Volatile Storage
SRC	System Reset Controller
USB	Used for Serial download of a boot device provisioning program
uSDHC	Ultra-Secure Digital Host Controller
WDOG 1	WatchDog Timer
TRNG	True Random Number Generator
PIT	Periodic Interrupt Timer
Hash-AES	Crypto module

### 9.5.3 Clocks at boot time

The following table provides the clock frequency configurations for the boot core.

**Table 9-5. Normal Frequency Clock Configurations**

BOOT_FREQ(0x460[2])	LPB_BOOT(0x470[22:21])	Core Clock Frequency(MHz)
0	0	396
	1	198
	2	99
	3	49.5
1	0	528
	1	264
	2	132
	3	66

Following reset, the Arm core has access to all peripherals. The ROM code will disable the clocks associated with the following Clock Gate Enables. See [System Clocks](#) for information about the CCM output clocks' system-level connectivity.

**Table 9-6. List of Disabled Clock Gate Enables**

CCM_ANALOG_PLL_USB1	0x80003040

### NOTE

1. The boot ROM enables MPU protection under HAB-closed mode, to prevent execution of any other supported memory regions than the ROM region, during boot code execution.

This feature puts restrictions on the SW debug on the RT106x chip. The debug tool needs to disable the MPU first, before executing the code on the device under HAB-closed mode.

2. The boot ROM enables LUART1 and USB1 interrupts in serial downloader mode, and it disables these interrupts before jumping to user applications. However, if the boot ROM execution is interrupted by the debug tool, it cannot disable these interrupts; the user application needs to disable these interrupts in the startup codes.
3. The boot ROM configures the PIT channel 0 and channel 1 registers but does not restore them before jumping to boot image. The user application needs to re-configure the PIT channels explicitly instead of relying on the default register values.
4. The PFD\_480\_PFD1 is selected as the FLEXSPI clock source. The user application needs to take special care on adjusting the PFD\_480\_PFD1 setting in the XiP boot case because the clock update impacts the FLEXSPI timing.

#### 9.5.4 Enabling Caches

The boot ROM includes a feature that enables the caches to improve the boot speed.

L1 instruction cache is enabled at the start of image download. The L1 data cache is enabled at the start of image authentication. Both the caches are disabled by ROM before leaving the ROM execution.

By default, the L1-ICache and DCache are enabled by ROM. However, there are fuse bits that can be programmed for ROM not to enable the L1 I/DCache at boot.

The Cache features are controlled by the BT\_ICACHE\_DISABLE fuse and BT\_DCACHE\_DISABLE fuses. By default, both fuses are not blown meaning the ROM uses the L1-ICache and L1-DCache of the Arm core. This improves the performance of the HAB signature verification software.

## 9.5.5 Exception handling

The exception vectors (interrupt vectors/vector table) are located at the start of ROM. During the boot phase, CPU loads the SP and PC from exception vectors and then boot to ROM.

After booting, the program image can relocate the vectors as required.

## 9.5.6 Interrupt handling during boot

No special interrupt-handling routines are required during the boot process. The interrupts are disabled during the boot ROM execution and may be enabled in a later boot stage.

## 9.5.7 Persistent bits

Some modes of the boot ROM require the registers that keep their values after a warm reset. The SRC General-Purpose registers are used for this purpose.

See this table for persistent bits list and description:

**Table 9-8. Persistent bits**

Bit name	Bit location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used—primary and secondary. Used only for eMMC/SD/FlexSPI NOR boot.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds the entry function for the CPU0 to wake up from the low-power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds the argument of entry function for the CPU0 to wake up from the low-power mode.
PERSIST_REDUNDANT_BOOT	SRC_GPR10[27:26]	This field identifies which image must be used - 0/1/2/3. Used for both SPI NAND and SLC raw NAND devices.

## 9.6 Boot devices

The chip supports the following boot flash devices:

- Serial NOR flash via FlexSPI Interface
- Serial NAND Flash via FlexSPI Interface

## Boot devices

- Parallel NOR flash with the Smart External Memory Controller (SEMC), located on CS0, 16-bit bus width.
- NAND Flash with SEMC interface, located on CS0, 8-bit/16-bit bus width.
- SD/MMC/eSD/SDXC/eMMC4.4 via uSDHC interface, supporting high capacity cards
- Serial NOR/EEPROM boot via LPSPI

The selection of the external boot device type is controlled by the BOOT\_CFG1[7:4] eFUSES. See this table for more details:

**Table 9-9. Boot device selection**

BOOT_CFG1[7:4]	Boot device
0000b	Serial NOR boot via FlexSPI
01xxb	SD Boot via uSDHC
10xxb	eMMC/MMC boot via uSDHC
001xb	SLC NAND boot via SEMC
0001b	Parallel NOR boot via SEMC
11xxb	Serial NAND boot via FlexSPI

## NOTE

A user can use the LPSPI to boot from Serial NOR/EEPROM. Booting from Serial NOR/EEPROM via an LPSPI port is not intended as the primary device, but as a recovery boot device if the primary boot device fails.

In order to enable a recovery boot device, EEPROM\_RECOVERY\_EN fuse must be set to 1, and other fuses listed in [Serial NOR/EEPROM eFUSE configuration](#) must be properly set.

## 9.6.1 Serial NOR Flash Boot via FlexSPI

### 9.6.1.1 Serial NOR eFUSE Configuration

**Table 9-10. Fuse definition for Serial NOR over FlexSPI**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG1[0]	OEM	xSPI FLASH Auto Probe	Yes	0	0 – Disabled 1 – Enabled

*Table continues on the next page...*

**Table 9-10. Fuse definition for Serial NOR over FlexSPI (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG1[1]	OEM	Encrypted XIP	Yes	0	0 – Disabled 1 – Enabled
BOOT_CFG1[3:2]	OEM	xSPI FLASH Auto Probe Type	Yes	0	0 – QuadSPI NOR 1 – MXIC Octal 2 – Micron Octal 3 – Adesto Octal
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0	0 – Serial NOR device is selected as boot device
BOOT_CFG2[2:0]	OEM	Flash Type	Yes	0	000b–Device supports 3B (0x03 + 24-bit Address) read by default (command: 0x03, SPI mode) 001b–Device supports 4B (0x13 + 24-bit Address) read by default (command: 0x13, SPI mode) 010b–HyperFlash 1V8 (HyperBus Protocol) 011b–HyperFlash 3V3 (HyperBus protocol) 100b–MXIC Octal DDR (command: 0xEE,0x11, OPI mode) 101b–Micron Octal DDR (command: 0xFD, OPI mode) 110b–Reserved 111b–QSPI device supports 3B read by default (on secondary pinmux option) (command: 0x03, SPI mode)
0x6E0[3:1] (BOOT_CONFIG_MISC)	OEM	xSPI FLASH Frequency	No	0	0 – 100MHz 1 – 120MHz 2 – 133MHz 3 – 166MHz 5 – 80MHz 6 – 60MHz Others – Reserved
0x6E0[5:4] (BOOT_CONFIG_MISC)	OEM	Hold time before access the Flash device	No	0	0 – 500us 1 – 1ms 2 – 3ms 3 – 10ms
0x6E0[11:8] (BOOT_CONFIG_MISC)	OEM	xSPI FLASH Dummy Cycle	No	0	0 – Dummy cycles is auto-probed Others – Actual dummy cycles for Read command

*Table continues on the next page...*

**Table 9-10. Fuse definition for Serial NOR over FlexSPI (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
0x6E0[15:12] (BOOT_CONFIG_MISC)	OEM	xSPI FLASH image size	No	0	0 – Image size equals to Secondary Image offset 1 – 1MB 2 – 2MB ... – ... 12 – 12MB 13 – 256KB 14 – 512KB 15 – 768KB
0x6E0[23:16] (BOOT_CONFIG_MISC)	OEM	xSPI FLASH_SEC_IMAGE_OF_FSET	No	0	Offset = 256KB × fuse value

**NOTE**

If the xSPI FLASH Auto Probe feature is enabled, the following is the logic how this feature works with other fuse combinations:

- Flash Type - If Flash type is 0, the "xSPI FLASH Auto Probe Type" takes effect for the Flash type selection. If Flash Type is greater than 1, the "Flash Type" fuse is used for Flash type selection, ROM will issue specific command to probe the presence of Serial NOR FLASH.
- xSPI FLASH Frequency - This field is used for specifying the Flash working frequency.

### 9.6.1.2 FlexSPI Serial NOR Flash Boot Operation

The Boot ROM attempts to boot from Serial NOR flash if the BOOT\_CFG1 [7:4] fuses are programmed to 0b'0000 as shown in the Serial NOR eFUSE Configuration table, then the ROM will initialize FlexSPI interface. FlexSPI interface initialization is a two-step process.

1. The ROM expects the 512-byte FlexSPI NOR configuration parameters (as explained in the next section) to be present at offset 0 in Serial NOR flash attached to FLEXSPI\_A\_SS0\_B. The ROM can probe the presence of Serial NOR Flash and generate these configuration parameters accordingly via the combination of Fuses in

the table above, or reads these configuration parameters using the read command specified by BOOT\_CFG 2[2:0] with serial clock operating at 30 MHz.

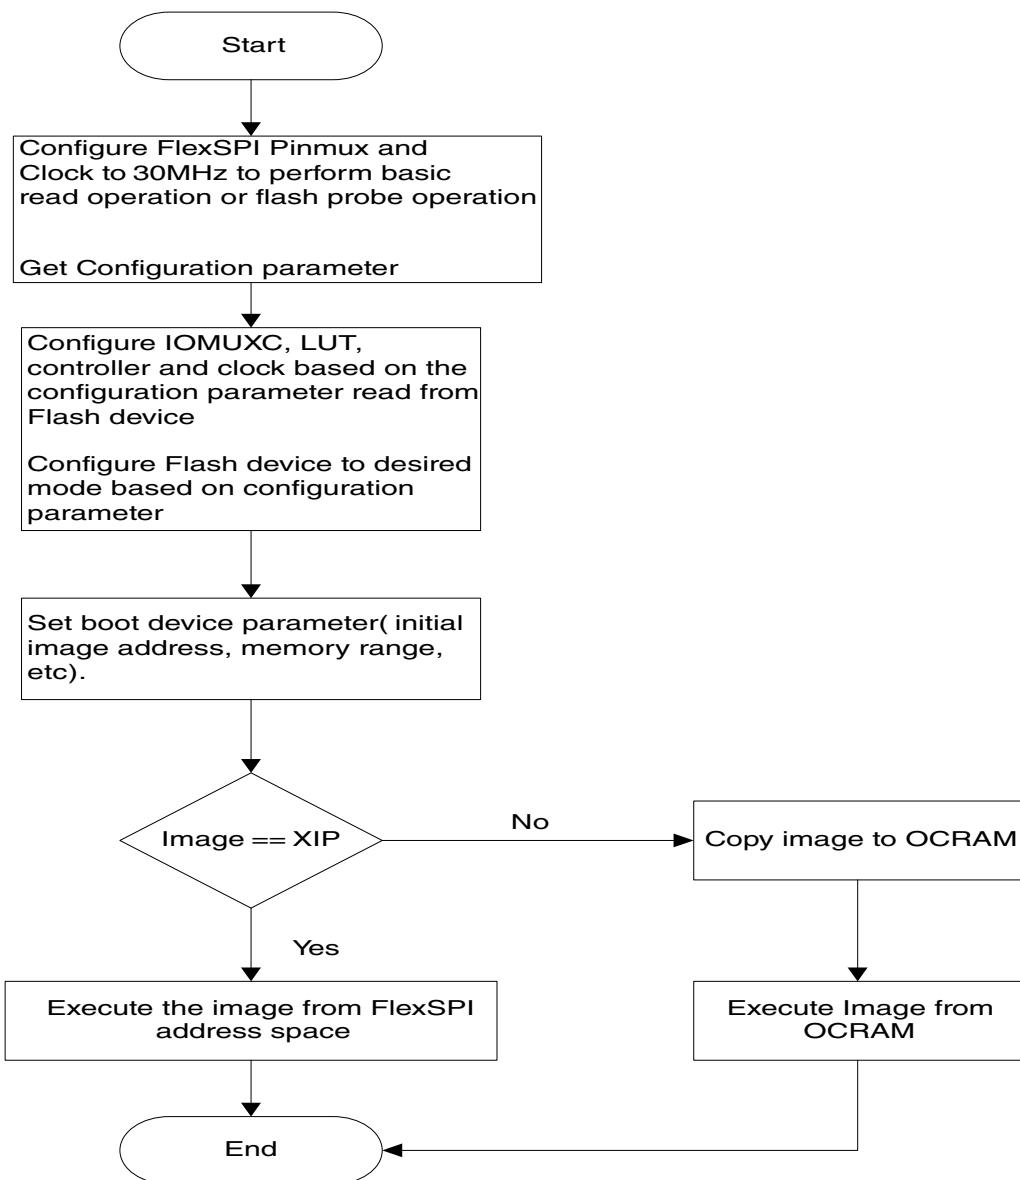

2. ROM configures FlexSPI interface with the parameters provided in configuration block read from Serial NOR flash and starts the boot procedure. Refer to [Table 9-18](#) for details regarding FlexSPI configuration parameters and to the FlexSPI NOR boot flow chart for detailed boot flow chart of FlexSPI NOR.

Both booting an XIP and non XIP image are supported from Serial NOR Flash. For XIP boot, the image has to be built for FlexSPI address space; and for non XIP, the image can be built to execute from internal RAM.

### NOTE

A non-XIP image's execute address space should NOT be overlapped with the reserved OCRAM region described in the section "Internal ROM/RAM memory map". And it is also highly recommended to avoid using address space near 0x00000000, typically up to 0x00000003.

### 9.6.1.3 FlexSPI NOR boot flow chart

**Figure 9-3. FlexSPI NOR boot flow**

### 9.6.2 Serial NAND Flash Boot over FlexSPI

The boot ROM supports a number of Serial NAND Flash devices from different vendors. The Embedded Error Correction and Control (ECC) module in SPI NAND devices are used to detect and correct the errors.

### 9.6.2.1 Serial NAND eFUSE Configuration

The boot ROM determines the configuration of external Serial NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins during boot. See below table for parameters details.

**Table 9-11. Fuse definition for Serial NAND over FlexSPI**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG1[1:0]	OEM	Search Stride for FCB and DBBT Search strides in terms of page	Yes	0	0 - 64 1 - 128 2 - 256 3 - 32
BOOT_CFG1[3:2]	OEM	Hold Time before access to Serial NAND	Yes	0	0 - Hold time determined by Read Status command 1 - 500us 2 - 1ms 3 - 3ms
BOOT_CFG1[4]	OEM	Column address width	Yes	0	0 - 12 bits 1 - 13 bits
BOOT_CFG1[5]	OEM	Default safe communication frequency	Yes	0	0 – High Speed (50MHz) 1 – Low Speed (30MHz)
BOOT_CFG1[7:6]	OEM	Primary boot device selection	Yes	0	00 – Serial NOR 11 – Serial NAND
BOOT_CFG2[0]	OEM	Boot Search Count of FCB and DBBT	Yes	0	0 - 1 1 - 2
BOOT_CFG2[2:1]	OEM	CS de-asserted interval between two commands	Yes	0	0 – 100ns 1 – 200ns 2 – 400ns 3 – 50ns
0x6E0[3:0]	OEM	SPI NAND BOOT - Busy Bit offset	No	0	
0x6E0[7]	OEM	SPI NAND BOOT - Override Busy Offset	No	0	0 – Use default busy bit offset 0 1 – Override default busy bit offset using Busy bit offset
0x6E0[13:8]	OEM	SPI NAND Boot - Page Read Time (in terms of micro seconds)	No	0	

*Table continues on the next page...*

**Table 9-11. Fuse definition for Serial NAND over FlexSPI (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
0x6E0[23:16]	OEM	Page Read Command	No	0	Available only if it is not 0
0x6F0[31:24]	OEM	Cache Read command	No	0	Available only if it is not 0

**NOTE**

BOOT\_CFGx sampled on GPIO pins depends on BT\_FUSE\_SEL setting.

BT\_FUSE\_SEL = 1 is programmed on every Teensy board.  
BOOT\_CFGx pins do not override eFuse values during boot.

### 9.6.2.2 FlexSPI NAND Flash Boot Flow and Boot Control Blocks (BCB)

There are two BCB data structures:

- FCB
- DBBT

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

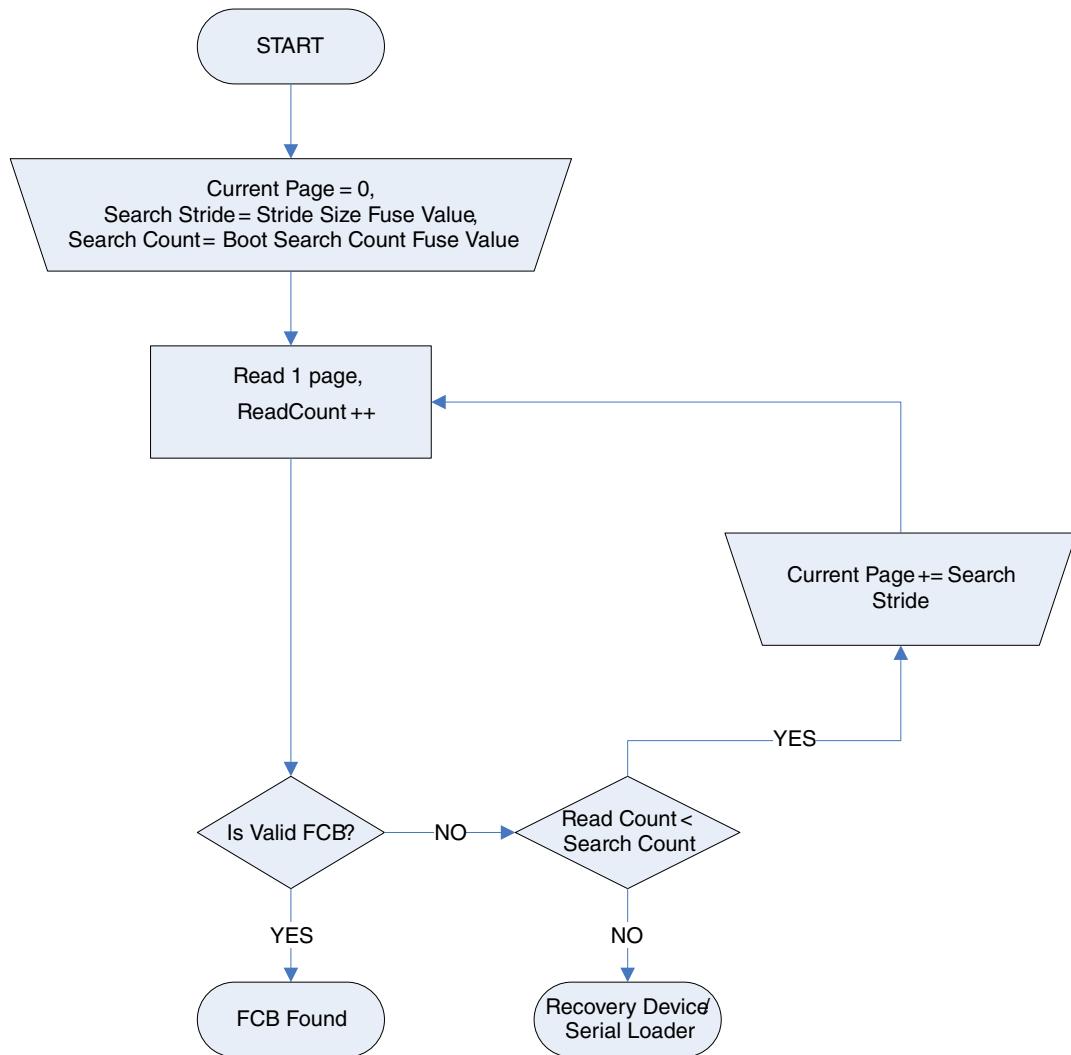

The built-in HW ECC in Serial NAND device is used during data read, the FCB data structure is protected using CRC checksum. Driver reads raw 2048 bytes of first sector and runs through CRC check that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

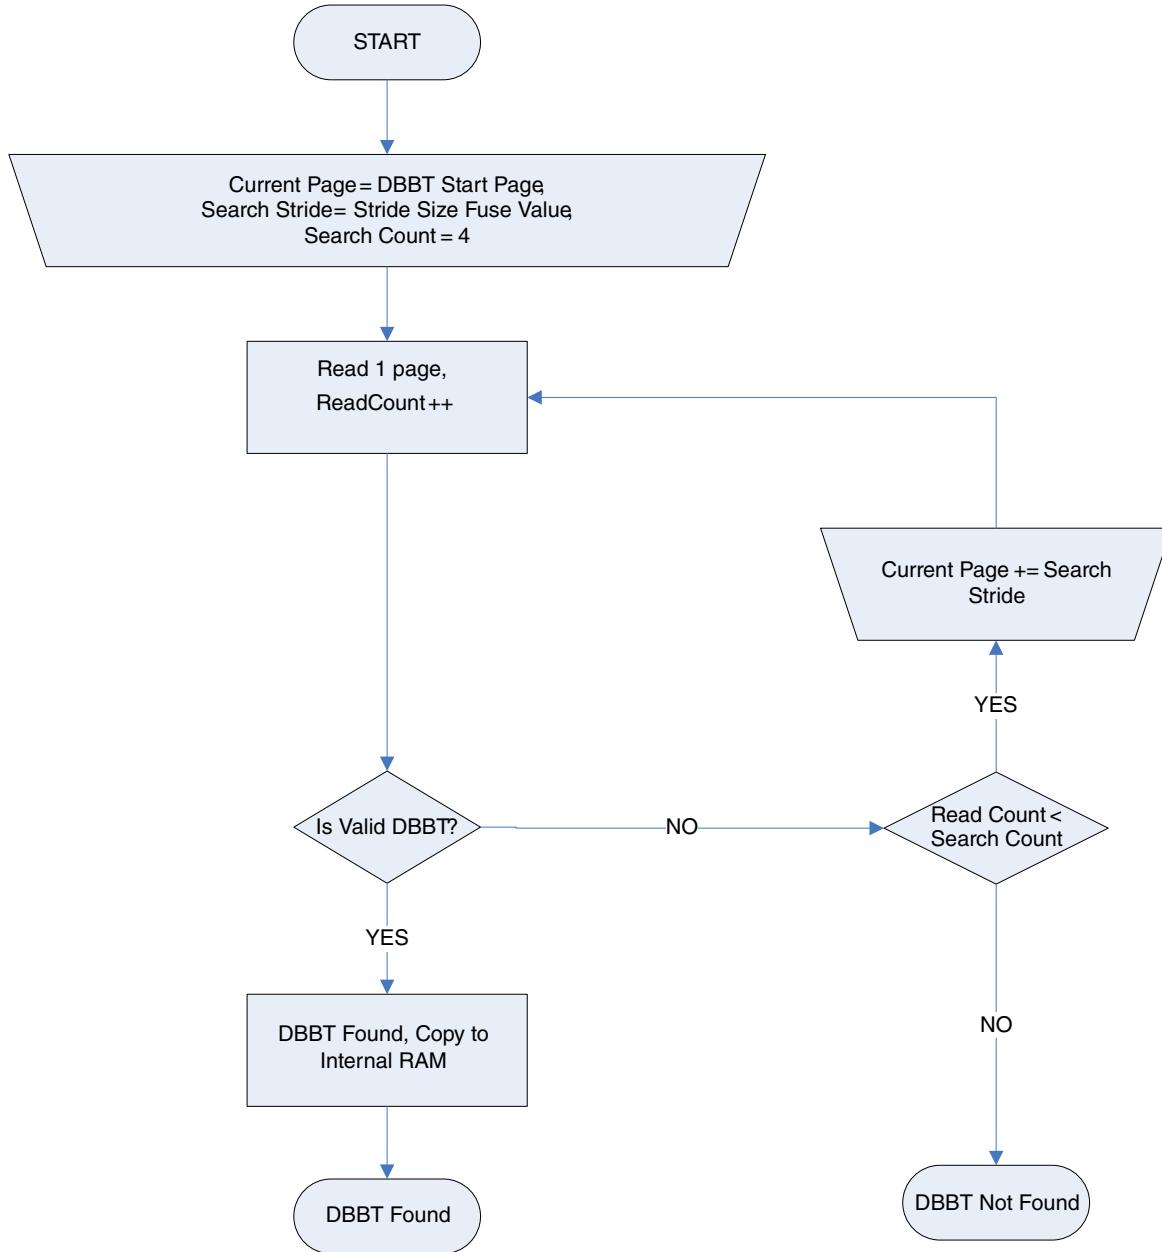

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

The FCB contains the page address of DDBT Search Area, and the page address for primary and secondary boot images. DDBT is searched in DDBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

Figure 9-4 shows the state diagram of FCB search.

**Figure 9-4. FCB Search Flow**

After FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBTSearchStartPage is 0 in the FCB, then ROM assumes that there are no bad blocks in the NAND device boot area. See [Figure 9-5](#) for the DDBT search flow.

**Figure 9-5. DBBT Search Flow**

The BCB search and load function also monitors the ECC correction threshold and sets the PERSIST\_BLOCK\_REWRITE persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on PERSIST\_SECONDARY\_BOOT bit and perform SW reset (After SW reset, secondary image is used).

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM goes to serial downloader.

### 9.6.2.3 Firmware Configuration Block

The FCB is at the first page in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, in case the first Serial NAND block becomes corrupted, the ROM will find its copy in the next Serial NAND block. The search area should span over at least two Serial NAND blocks. The location information for DBBT search area and images are all specified in the FCB. The following table shows the Flash Control Block Structure.

**Table 9-12. Flash Control Block Structure**

Name	Offset	Size Bytes	Description									
crcChecksum	0x000	4	Cheksum									
fingerprint	0x004	4	0x4E46_4342 ASCII: "NFCB"									
version	0x008	4	0x0000_0001									
DBBTSearchStartPage	0x00C	4	Start Page address for bad block table search area									
searchStride	0x010	2	Search stride for DBBT and FCB search. Not used by ROM Max value is 8.									
searchCount	0x012	2	Copies of DBBT and FCB. Not used by ROM, max value is 8.									
firmwareCopies	0x014	4	Firmware copies Valid range 1-4.									
Reserved	0x018	40	Reserved for future use Must be set to 0.									
firmwareInfoTable	0x40	64	This table consists of (up to 8 entries): <table border="1" data-bbox="1142 1534 1468 1845"> <thead> <tr> <th>Field</th><th>Size</th><th>Description</th></tr> </thead> <tbody> <tr> <td>StartPage</td><td>4</td><td>Start page of this firmware</td></tr> <tr> <td>pageCount</td><td>4</td><td>Pages in this firmware</td></tr> </tbody> </table>	Field	Size	Description	StartPage	4	Start page of this firmware	pageCount	4	Pages in this firmware
Field	Size	Description										
StartPage	4	Start page of this firmware										
pageCount	4	Pages in this firmware										

*Table continues on the next page...*

**Table 9-12. Flash Control Block Structure  
(continued)**

Name	Offset	Size Bytes	Description
			<b>NOTE:</b> The StartPage must be the first page of a NAND block.
Reserved	0x080	128	Reserved Must be set to 0
spiNandConfigBlock	0x100	512	Serial NAND configuration block over FlexSPI
Reserved	0x300	256	Must be set to 0

**NOTE**

1. The “crcChecksum” is calculated with an MPEG2 variant of CRC-32. See [Table 9-13](#) for more details.
2. The “crcChecksum” calculation starts from fingerprint to the end of FCB, 1020 bytes in total.
3. The “spiNandConfigBlock” is FlexSPI NAND configuration block which consists of common FlexSPI memory configuration block and Serial NAND specified configuration parameters.

**Table 9-13. CRC-32 variant algorithm**

Property	Description
Width	32 bits
Polynomial	0x04C11DB7
Init Value	0xFFFFFFFF
Reflect in	False
Reflect Out	False
XOR Out	0x00000000

**9.6.2.4 Discovered Bad Blocks Table (DBBT)****Table 9-14. DBBT Structure**

Name	Offset	Size in Bytes	Description
crcChecksum	0x000	4	Checksum
Fingerprint	0x004	4	32-bit word with a value of 0x4442_4254, in ASCII “DBBT”

*Table continues on the next page...*

**Table 9-14. DBBT Structure (continued)**

Name	Offset	Size in Bytes	Description
Version	0x008	4	32-bit version number, this version of DBBT is 0x00000001
-	0x00C	4	Reserved
badBlockNumber	0x010	4	Number of bad blocks
Reserved	0x014	12	Must be filled with 0x00s
Bad Block entries	0x020	1024 (256*4)	Each bad block entry is a 32-bit value specifying the number of a found bad block. The number of valid bad block entries is specified by the badBlockNumber field, where valid bad block entries are stored sequentially starting at the beginning of the bad block entries segment. Unused bad block entries (those beyond the badBlockNumber) should be filled with 0xFFs.

**NOTE**

1. Maximum badBlockNumber is 256.
2. The "crcChecksum" is calculated with the same algorithm as the one in FCB, from Fingerprint to the end of DBBT, 1052 bytes in total.

### 9.6.2.5 Bad block handling in ROM

During the firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

### 9.6.3 Serial NOR and NAND Configuration based on FlexSPI Interface

The ROM SW supports Serial NOR and Serial NAND based on FlexSPI module, using a 448-bytes common FlexSPI configuration block and several specified parameters for Serial NOR and Serial NAND respectively. See the following sections for more details.

### 9.6.3.1 FlexSPI Configuration Block

FlexSPI Configuration block consists of parameters regarding specific Flash devices including read command sequence, quad mode enablement sequence (optional), etc.

**Table 9-15. FlexSPI Configuration block**

Name	Offset	Size(bytes)	Description
Tag	0x000	4	0x42464346, ascii: 'FCFB'
Version	0x004	4	0x56010000 / 0x56010100 [07:00] bugfix = 0 [15:08] minor [23:16] major = 1 [31:24] ascii 'V'
-	0x008	4	Reserved
readSampleClkSrc	0x00C	1	0 – internal loopback 1 – loopback from DQS pad 3 – Flash provided DQS
csHoldTime	0x00D	1	Serial Flash CS Hold Time Recommend default value is 0x03
csSetupTime	0x00E	1	Serial Flash CS setup time Recommended default value is 0x03
columnAdressWidth	0x00F	1	3 – For HyperFlash 12/13 – For Serial NAND, see the NAND FLASH datasheet to find the correct value 0 – Other devices
deviceModeCfgEnable	0x010	1	Device Mode Configuration Enable feature 0 – Disabled 1 – Enabled
-	0x011	1	Reserved
waitTimeCfgCommands	0x012	2	Wait time for all configuration commands, unit 100us. Available for device that support v1.1.0 FlexSPI configuration block. If it is greater than 0, ROM will wait waitTimeCfgCommands * 100us for all device memory configuration commands instead of using read status to wait until these commands complete.
deviceModeSeq	0x014	4	Sequence parameter for device mode configuration Bit[7:0] - number of LUT sequences for Device mode configuration command Bit[15:8] - starting LUT index of Device mode configuration command Bit[31:16] - must be 0
deviceModeArg	0x018	4	Device Mode argument, effective only when deviceModeCfgEnable = 1

*Table continues on the next page...*

**Table 9-15. FlexSPI Configuration block (continued)**

Name	Offset	Size(bytes)	Description
configCmdEnable	0x01C	1	Config Command Enable feature 0 – Disabled 1 – Enabled
-	0x01D	3	Reserved
configCmdSeqs	0x020	12	Sequences for Config Command, allow 3 separate configuration command sequences.
-	0x02C	4	Reserved
cfgCmdArgs	0x030	12	Arguments for each separate configuration command sequence.
-	0x03C	4	Reserved
controllerMiscOption	0x040	4	Bit0 – differential clock enable Bit1 – CK2 enable, must set to 0 in this silicon Bit2 – ParallelModeEnable, must set to 0 for this silicon Bit3 – wordAddressableEnable Bit4 – Safe Configuration Frequency enable set to 1 for the devices that support DDR Read instructions Bit5 – Pad Setting Override Enable Bit6 – DDR Mode Enable, set to 1 for device supports DDR read command
deviceType	0x044	1	1 – Serial NOR 2 – Serial NAND
sflashPadType	0x045	1	1 – Single pad 2 – Dual pads 4 – Quad pads 8 – Octal pads
serialClkFreq	0x046	1	Chip specific value, for this silicon 1 – 30 MHz 2 – 50 MHz 3 – 60 MHz 4 – 75 MHz 5 – 80 MHz 6 – 100 MHz 7 – 120 MHz 8 – 133 MHz 9 - 166 MHz Other value: 30 MHz
lutCustomSeqEnable	0x047	1	0 – Use pre-defined LUT sequence index and number 1 - Use LUT sequence parameters provided in this block
-	0x048	8	Reserved

*Table continues on the next page...*

**Table 9-15. FlexSPI Configuration block (continued)**

Name	Offset	Size(bytes)	Description
sflashA1Size	0x050	4	For SPI NOR, need to fill with actual size For SPI NAND, need to fill with actual size * 2
sflashA2Size	0x054	4	The same as above
sflashB1Size	0x058	4	The same as above
sflashB2Size	0x05C	4	The same as above
csPadSettingOverride	0x060	4	Set to 0 if it is not supported
sclkPadSettingOverride	0x064	4	Set to 0 if it is not supported
dataPadSettingOverride	0x068	4	Set to 0 if it is not supported
dqsPadSettingOverride	0x06C	4	Set to 0 if it is not supported
timeoutInMs	0x070	4	Maximum wait time during read busy status 0 – Disabled timeout checking feature Other value – Timeout if the wait time exceeds this value
commandInterval	0x074	4	Unit: ns Currently, it is used for SPI NAND only at high frequency
dataValidTime	0x078	4	Time from clock edge to data valid edge, unit ns. This field is used when the FlexSPI Root clock is less than 100 MHz and the read sample clock source is device provided DQS signal without CK2 support. [31:16] data valid time for DLLB in terms of 0.1 ns [15:0] data valid time for DLLA in terms of 0.1 ns
busyOffset	0x07C	2	busy bit offset, valid range :0-31
busyBitPolarity	0x07E	2	0 – busy bit is 1 if device is busy 1 – busy bit is 0 if device is busy
lookupTable	0x080	256	Lookup table
lutCustomSeq	0x180	48	Customized LUT sequence, see below table for details.
	0x1B0	16	Reserved for future use

**Note:**

1. To customize the LUT sequence for some specific device, users need to enable “lutCustomSeqEnable” and fill in corresponding “lutCustomSeq” field specified by command index below.
2. For Serial (SPI) NOR, the pre-defined LUT index is as follows:

**Table 9-16. LUT sequence definition for Serial NOR**

Command Index	Name	Index in lookup table	Description
0	Read	0	Read command Sequence
1	ReadStatus	1	Read Status command

*Table continues on the next page...*

**Table 9-16. LUT sequence definition for Serial NOR  
(continued)**

Command Index	Name	Index in lookup table	Description
2	WriteEnable	3	Write Enable command sequence
3	EraseSector	5	Erase Sector Command
4	PageProgram	9	Page Program Command
5	ChipErase	11	Full Chip Erase
6	Dummy	15	Dummy Command as needed
7-12	Reserved	2,4,6,7,8,10,12,13,14	All reserved indexes can be freely used for other purpose
13	NOR_CMD_LUT_SE Q_IDX_READ_SFDP	13	Read SFDP sequence in lookupTable id stored in config block
14	NOR_CMD_LUT_SE Q_IDX_RESTORE_N OCMD	14	Restore 0-4-4/0-8-8 mode sequence id in lookupTable stored in config block

3. For Serial (SPI) NAND, the pre-defined LUT index is as follows:

**Table 9-17. LUT sequence definition for Serial NAND**

Command Index	Name	Index in lookup table	Description
0	ReadFromCache	0	Read from cache
1	ReadStatus	1	Read Status
2	WriteEnable	3	Write Enable
3	BlockErase	5	Erase block
4	ProgramLoad	9	Program Load
5	ReadPage	11	Read page to cache
6	ReadEccStatus	13	Read ECC Status
7	ProgramExecute	14	Program Execute
8	ReadFromCacheOdd	4	Read from Cache while page in odd plane
9	ProgramLoadOdd	10	Program Load for pages within odd blocks
	Reserved	2,6,7,8,12,15	All reserved indexes can be freely used for other purposes

**NOTE**

1. All the pre-defined LUT indexes are only applicable to boot stage. User application can use the whole 16 LUT entries freely based on their requirement.
2. The FlexSPI NOR ROM APIs occupy LUT index 0-5. User application should **NOT** use these LUT indexes if the ROM API is called in their application frequently.

**9.6.3.2 Serial NOR configuration block (512 bytes)****Table 9-18. Serial NOR configuration block**

Name	Offset	Size (Bytes)	Description
memCfg	0	448	The common memory configuration block, see FlexSPI configuration block for more details
pageSize	0x1C0	4	Page size in terms of bytes, not used by ROM
sectorSize	0x1C4	4	Sector size in terms of bytes, not used by ROM
ipCmdSerialClkFreq	0x1C8	1	Chip specific value, not used by ROM 0 – No change, keep current serial clock unchanged 1 – 30 MHz 2 – 50 MHz 3 – 60 MHz 4 – 75 MHz 5 – 80 MHz 6 – 100 MHz 7 – 120 MHz 8 – 133 MHz 9 – 166 MHz
Reserved	0x1CC	55	Reserved for future use

### 9.6.3.3 Serial NAND configuration block (512 bytes)

Table 9-19. Serial NAND configuration block

Name	Offset	Size (Bytes)	Description
memCfg	0	448	The common memory configuration block, see FlexSPI configuration block for more details
pageDataSize	0x1C0	4	Page size in terms of bytes, usually, it is 2048 or 4096
pageTotalSize	0x1C4	4	It equals to $2^{\wedge}$ width of column address
pagesPerBlock	0x1C8	4	Pages in one block
bypassReadStatus	0x1CC	1	0 – Read Status Register 1 – Bypass Read status register
bypassEccRead	0x1CD	1	0 – Perform ECC read 1 – Bypass ECC read
hasMultiPlanes	0x1CE	1	0 – Only 1 plane 1 – Has two planes
skippOddBlocks	0x1CF	1	0 – Read Odd blocks 1 – Skip Odd blocks
eccCheckCustomEnable	0x1D0	1	0 – Use the common ECC check command and ECC related masks 1 - Use ECC check related masks provided in this configuration block
ipCmdSerialClkFreq	0x1D1	1	Chip specific value, not used by ROM 0 – No change, keep current serial clock unchanged 1 – 30 MHz 2 – 50 MHz 3 – 60 MHz 4 – 75 MHz 5 – 80 MHz 6 – 100 MHz 7 – 120 MHz 8 – 133 MHz 9 – 166 MHz
readPageTimeUs	0x1D2	2	Wait time during page read, this field will take effect on if the bypassReadStatus is set to 1.

Table continues on the next page...

**Table 9-19. Serial NAND configuration block (continued)**

Name	Offset	Size (Bytes)	Description
			<b>NOTE:</b> Only applicable to ROM.
eccStatusMask	0x1D4	4	ECC Status Mask

## 9.6.4 Parallel NOR flash Boot over SEMC

The Smart External Memory Controller (SEMC) works in an asynchronous mode, and supports Muxed Address/Data scheme.

### 9.6.4.1 Parallel NOR eFuse Configuration

The boot ROM determines the configuration of external Parallel NOR flash by parameters, either provided by eFuse, or sampled on GPIO pins during boot. See below table for parameters details.

**Table 9-20. Fuse definition for Parallel NOR over SEMC**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG [7:4]	OEM	Primary boot device selection	Yes	0000	0001 – Parallel NOR
BOOT_CFG [2:0]	OEM	SEMC Clock frequency	Yes	000	000 – 33MHz 001 – 66MHz 010 – 108MHz 011 – 133MHz 1xx – 166MHz
BOOT_CFG [8]	OEM	AC timing parameter configuration	Yes	0	0 – Default configuration 1 – Configured by Fuse
BOOT_CFG [9]	OEM	Data port size	Yes	0	0 – 16 bits 1 – 8 bits
BOOT_CFG [10]	OEM	DQS pin pad enablement	Yes	0	0 – Disabled 1 – Enabled
0x6E0[2:0]	OEM	PCS pin selection	No	000	000 – CSX0 001 – CSX1 010 – CSX2

*Table continues on the next page...*

**Table 9-20. Fuse definition for Parallel NOR over SEMC (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
					011 – CSX3 1xx – A8
0x6E0[5:3]	OEM	Address port size	No	000	0xx – <= 24 bits 100 – 25 bits 101 – 26 bits 110 – 27 bits 111 – 28 bits
0x6E0[6]	OEM	ADV pin polarity	No	0	0 – Low active 1 – High active
0x6E0[7]	OEM	RDY pin polarity	No	0	0 – High active 1 – Low active
0x6E0[9:8]	OEM	AC timing parameter - CES	No	00	Value = (CES*5 + 1) cycle
0x6E0[11:10]	OEM	AC timing parameter - CEH	No	00	Value = (CEH*5 + 1) cycle
0x6E0[13:12]	OEM	AC timing parameter - CEITV	No	00	Value = (CEITV*5 + 1) cycle
0x6E0[15:14]	OEM	AC timing parameter - TA	No	00	Value = (TA*5 + 1) cycle
0x6E0[19:16]	OEM	AC timing parameter - AS	No	0000	Value = (AS + 1) cycle
0x6E0[23:20]	OEM	AC timing parameter - AH	No	0000	Value = (AH + 1) cycle
0x6E0[27:24]	OEM	AC timing parameter - REL	No	0000	Value = (REL + 1) cycle
0x6E0[31:28]	OEM	AC timing parameter - REH	No	0000	Value = (REH + 1) cycle

### 9.6.4.2 SEMC Parallel NOR Flash Boot Operation

The Boot ROM attempts to boot from Parallel NOR flash if the BOOT\_CFG [7:4] fuses are programmed to 0b'0001 as shown in the Parallel NOR eFuse Configuration table. ROM supports booting from both XIP and non-XIP images from Parallel NOR Flash. For XIP boot, the image has to be built for SEMC address space and for non XIP the image can be built to execute from Internal RAM.

## 9.6.5 Parallel NAND flash Boot over SEMC

The boot ROM supports a number of Parallel SLC NAND flash devices from different vendors. Both the Error Correction and Control (ECC) module in NAND device and software ECC algorithm (SECDED) in boot ROM can be used to detect the errors, based on the fuse settings.

### 9.6.5.1 Parallel NAND eFuse Configuration

The boot ROM determines the configuration of external Parallel NAND flash by parameters, either provided by eFuse, or sampled on GPIO pins, during boot. See below table for parameters details:

**Table 9-21. Fuse definition for Parallel NAND over SEMC**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG[0]	OEM	Boot Search count of FCB and DBBT	Yes	0 1 – 2	0 - 1 1 – 2
BOOT_CFG[4:1]	OEM	Search stride for FCB and DBBT in terms of pages	Yes	0000 Others – 2 ^ BOOT_SEARCH_STRIDE	0000 – 64 Others – 2 ^ BOOT_SEARCH_STRIDE
BOOT_CFG[7:5]	OEM	Primary boot device selection	Yes	000	001 – Parallel NAND
BOOT_CFG[8]	OEM	NAND ONFI compliant	Yes	0 1 – Non-ONFI	0 – ONFI 1.0 1 – Non-ONFI
BOOT_CFG [9]	OEM	ECC selection	Yes	0  <b>NOTE:</b> For “ECC selection” option, it can only be set as Device ECC When NAND device has built-in ECC module and the ECC module is enabled by default.	0 – Software ECC (SECDED) 1 – Device ECC  <b>NOTE:</b> For “ECC selection” option, it can only be set as Device ECC When NAND device has built-in ECC module and the ECC module is enabled by default.
BOOT_CFG [10]	OEM	DQS pin pad enablement	Yes	0 1 – Enabled	0 – Disabled 1 – Enabled
0x6E0[2:0]	OEM	PCS pin selection	No	000 001 – CSX1 010 – CSX2 011 – CSX3 1xx – A8	000 – CSX0 001 – CSX1 010 – CSX2 011 – CSX3 1xx – A8
0x6E0[4]	OEM	EDO mode	No	0	0 – Disabled

### 9.6.5.2 Parallel NAND Flash Boot Control Blocks (BCB)

There are two BCB data structures:

- Firmware Configuration Block (FCB)
- Discovered Bad Blocks Table (DBBT)

As part of the Parallel NAND media initialization, the ROM driver uses proper Parallel NAND parameters specified by FUSE to search for an FCB that contains the complete Parallel NAND parameters, page address of DBBT Search Area and Image info, including image copies, start page address and image size in terms of pages for each image.

FCB data structure is protected using Embedded ECC module in Parallel NAND devices or software ECC in ROM. The ROM driver reads 2048 bytes of first sector and checks the ECC check status to determine whether FCB data is valid or not.

If the FCB is found, the complete NAND parameters (Parallel NAND configuration block) are loaded for further reads, if the ECC fails, or the fingerprint does not match, or the CRC checksum does not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next FCB until Search Count pages have been read.

If search fails to find a valid FCB, the Parallel NAND driver responds with an error and the boot ROM enters into Recovery boot mode (Secondary boot, if it is enabled, or Serial download mode).

The FCB contains the page address of DBBT Search Area, and the info for images. DBBT is searched in DBBT Search area just like how FCB is searched. After the FCB is read, the DBBT is loaded, then the boot image is loaded using starting page address from FCB.

### 9.6.5.3 Firmware Configuration Block (FCB)

The FCB is at the first page in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, in case the first Serial NAND block becomes corrupted, the ROM will find its copy in the next Parallel NAND block. The search area should span over at least two Parallel NAND blocks. The location information for DBBT search area and images are all specified in the FCB. Below Table shows the FCB Structure.

Name	offset	Size (Bytes)	Description
bcbHeader	0x000	12	See <a href="#">Table 9-22</a> for details
DBBTSearchAreaStartPage	0x00c	4	Start Page address for bad block table search area
searchStride	0x010	2	Search stride for DDBT and FCB search. Not used by ROM Max value is 8.
searchCount	0x012	2	Copies of DDBT and FCB. Not used by ROM, max value is 8.
firmwareCopies	0x014	4	Firmware copies Valid range 1-4.
-	0x018	40	Reserved
firmwareTable	0x040	64	For details see <a href="#">Table 9-23</a>
-	0x080	128	Reserved
nandConfig	0x100	256	Parallel NAND configuration block over SEMC
-	0x200	512	Reserved

**Table 9-22. Header Description**

Field	Size	Description
crcChecksum	4	Checksum
fingerprint	4	0x4E46_4342 ASCII: "NFCB"
version	4	0x0000_0001

**Table 9-23. Table Descriptions**

Field	Size	Description
startPage	4	Start page of this firmware
pagesInFirmware	4	Pages in this firmware

**NOTE**

- The “crcChecksum” is calculated with an MPEG2 variant of CRC-32.

- The “crcChecksum” calculation starts from fingerprint to the end of FCB, 1020 bytes in total.
- The “nandConfig” is SEMC NAND configuration block which consists of common SEMC memory configuration block and Parallel NAND specified configuration parameters. See [Parallel NAND eFuse Configuration](#) for more details.

#### 9.6.5.4 Discovered Bad Blocks Table (DBBT)

Table 9-24. DBBT Structure

Name	offset	Size (Bytes)	Description
bcbHeader	0x000	12	See <a href="#">Table 9-25</a> for details
-	0x00C	4	Reserved
badBlockNumber	0x010	4	Number of bad blocks
-	0x014	12	Reserved
badBlockTable	0x020	1024 (256*4)	Each bad block entry is a 32-bit value specifying the number of a found bad block. The number of valid bad block entries is specified by the badBlockNumber field, where valid bad block entries are stored sequentially starting at the beginning of the bad block entries segment. Unused bad block entries (those beyond the badBlockNumber) should be filled with 0xFFs.

Table 9-25. Header Description

Field	Size	Description
crcChecksum	4	Checksum
fingerprint	4	0x4442_4254 ASCII: “DBBT”
version	4	0x0000_0001

#### NOTE

- Maximum bad block number is 256.
- The "crcChecksum" is calculated with the same algorithm as the one in FCB, from Fingerprint to the end of DBBT, 1052 bytes in total.

### 9.6.5.5 Bad block handling in ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block is checked.

### 9.6.6 Parallel NOR and NAND configuration based on SEMC interface

The ROM SW supports Parallel NOR and Parallel NAND based on SEMC module, using an 80-bytes common SEMC configuration block and several specified parameters for Parallel NOR and Parallel NAND respectively. See the following sections for more details.

#### 9.6.6.1 SEMC Configuration Block

SEMC Configuration block consists of all parameters related to specific Flash devices.

**Table 9-26. SEMC control block structure**

Name	offset	Size (Bytes)	Description
tag	0x000	4	0x434D4553, ascii:"SEMC"

## 9.6.7 Expansion device

The ROM supports booting from the MMC/eMMC and SD/eSD compliant devices.

### 9.6.7.1 Expansion device eFUSE configuration

The SD/MMC/eSD/eMMC/SDXC boot can be performed using the USDHC ports. The port can be configured based on either the setting of the BOOT\_CFG1[1] (Port Select) fuse or its corresponding GPIO overrides.

All USDHC ports support the fast boot. See this table for details:

**Table 9-31. USDHC eFuse Descriptions**

Fuse	Config	Definition	GPIO	Shipped value	Settings

0x6d0[5:0]	OEM	PAD_SETTINGS	Yes	000000	Override number

The boot code supports these standards:

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST\_BOOT
- SDXCv3.0

The MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4 KB of data from the MMC/SD/eSD/eMMC device to the internal RAM. After checking the Image Vector Table header value (0xD1) from program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts from the Boot Data Structure the destination pointer and length of image to be copied to the RAM device from where the code execution occurs.

The maximum image size to load into the SD/MMC boot is 32 MB. This is due to a limited number of uSDHC ADMA Buffer Descriptors allocated by the ROM.

### NOTE

The initial 4 KB of the program image must contain the IVT, DCD, and the Boot Data structures.

**Table 9-32. SD/MMC frequencies**

	SD	MMC	MMC (DDR mode)
Identification (KHz)	347.22		
Normal-speed mode (MHz)	25	20	25
High-speed mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

### NOTE

The boot ROM code reads the application image length and the application destination pointer from the image.

#### 9.6.7.2 MMC and eMMC boot

This table provides the MMC and eMMC boot details.

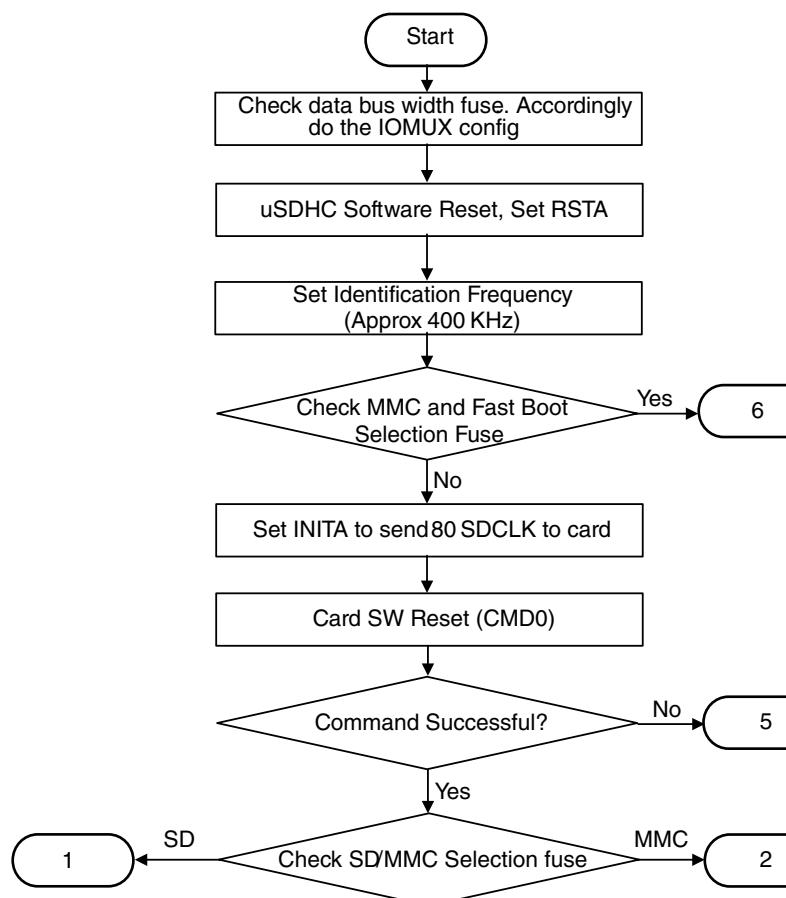

**Table 9-33. MMC and eMMC boot details**

Normal boot mode	<p>During the initialization (normal boot mode), the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, the voltage validation is performed, and the ROM boot code checks the high-voltage settings and the card capacity. The ROM boot code supports both the high-capacity and low-capacity MMC/eMMC cards. After the initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in the normal boot mode or 40 MHz in the high-speed mode). The eMMC is also interfaced via the USDHC and follows the same flow as the MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in the BOOT_PARTITION_ENABLE field or the user partition was mentioned, the ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 device supporting special boot mode	If using an eMMC4.3 or eMMC4.4 device that supports the special boot mode, it can be initiated by pulling the CMD line low. If the BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via the DATA lines and the

*Table continues on the next page...*

**Table 9-33. MMC and eMMC boot details (continued)**

	ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. The eMMC4.3/eMMC4.4 device with the "boot mode" feature can only be supported via the ESDHCV3-3 and with or without the BOOT ACK. If the BOOT ACK is enabled, the ROM waits 50 ms to get the BOOT ACK and if the BOOT ACK is received by the ROM. If BOOT ACK is disabled ROM waits 1 second for data. If the BOOT ACK or data was received, the eMMC4.3/eMMC4.4 is booted in the "boot mode", otherwise the eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by the BOOT_CFG1[4] (fast boot) fuse. The BOOT ACK is selected by the BOOT_CFG2[1].
eMMC4.4 device	If using the eMMC4.4 device, the Double Data Rate (DDR) mode can be used. This mode can be selected by the BOOT_CFG2[7:5] (bus width) fuse.

**Figure 9-12. Expansion device boot flow (6 of 6)**  
i.MX RT1060 Processor Reference Manual, Rev. 3, 07/2021

### 9.6.7.3 SD, eSD, and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, the SD/eSD/SDXC card voltage validation is performed. During the voltage validation, the boot code first checks with the high-voltage settings; if that fails, it checks with the low-voltage settings.

The capacity of the card is also checked. The boot code supports the high-capacity and low-capacity SD/eSD/SDXC cards after the voltage validation card initialization is done.

During the card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes that the card is a normal SD or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, the boot code switches to a higher frequency (25 MHz in the normal-speed mode or 50 MHz in the high-speed mode). The ROM also supports the FAST\_BOOT mode booting from the eSD card. This mode can be selected by the BOOT\_CFG1[0] (Fast Boot).

For the UHSI cards, the clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2 ports. This enables the voltage switch process to set the signaling voltage to 1.8 V during the voltage validation. The bus width is fixed at a 4-bit width and a sampling point tuning process is needed to calibrate the number of the delay cells. If the SD Loopback Clock eFuse is set, the feedback clock comes directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by the BOOT\_CFG1[5:4], and the SD Loopback Clock is selected by the BOOT\_CFG1[2].

The UHSI calibration start value (MMC\_DLL\_DL\_Y[6:0]) and the step value SD\_CALIBRATION\_STEP[1:0] can be set to optimize the sample point tuning process.

If the SD Power Cycle Enable eFuse is 1, the ROM sets the SD\_RST pad low, waits for 5 ms, and then sets the SD\_RST pad high. If the SD\_RST pad is connected to the SD power supply enable logic on board, it enables the power cycle of the SD card. This may be crucial in case the SD logic is in the 1.8 V states and must be reset to the 3.3 V states.

The SDR50 and SDR104 boots are not supported on the USDHC1 and USDHC2 ports because there are no reset signals for those ports when connected in the IOMUX.

### 9.6.7.4 Redundant boot support for expansion device

The ROM supports the redundant boot for an expansion device. The primary or secondary image is selected, depending on the PERSIST\_SECONDARY\_BOOT setting. (see [Table 9-8](#)).

If the PERSIST\_SECONDARY\_BOOT is 0, the boot ROM uses address 0x0 for the primary image.

If the PERSIST\_SECONDARY\_BOOT is 1, the boot ROM reads the secondary image table from address 0x200 on the boot media and uses the address specified in the table.

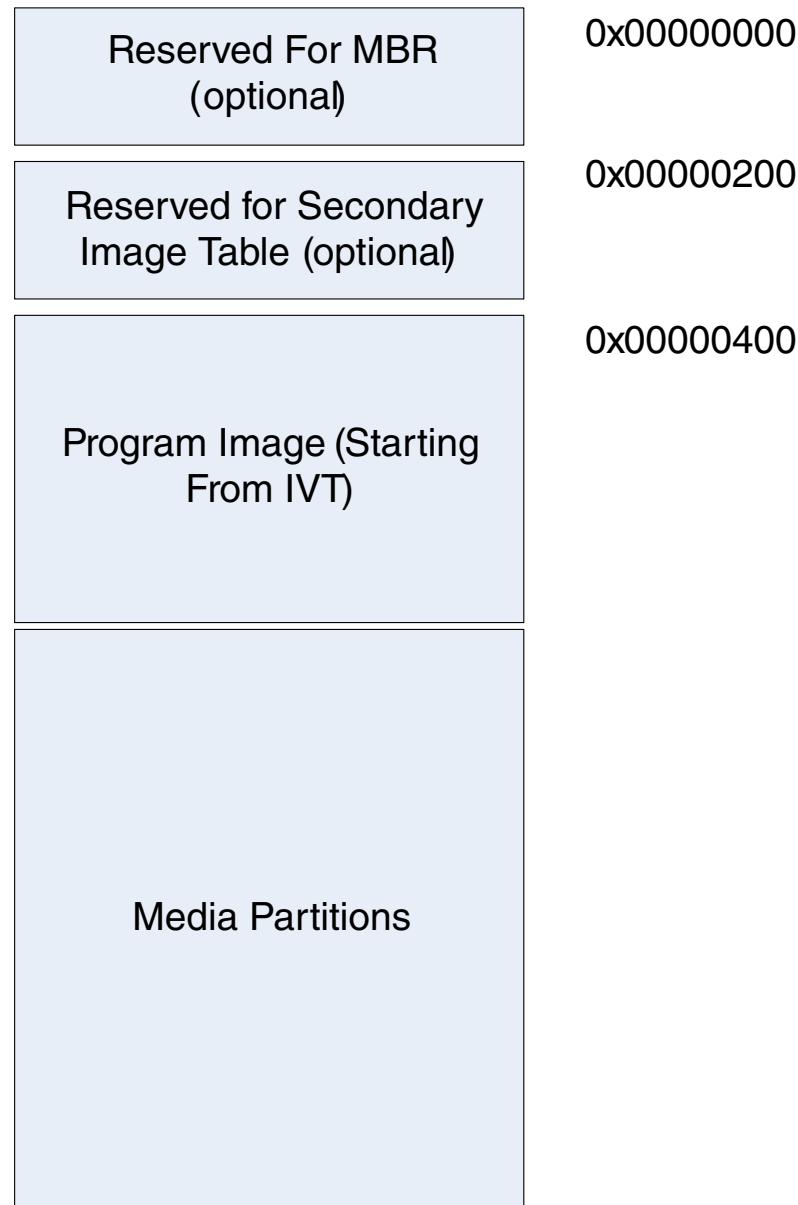

**Table 9-34. Secondary image table format**

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- The tag is used as an indication of the valid secondary image table. It must be 0x00112233.
- The firstSectorNumber is the first 512-byte sector number of the secondary image.

For the secondary image support, the primary image must reserve the space for the secondary image table. See this figure for the typical structures layout on an expansion device.

**Figure 9-13. Expansion device structures layout**

For the Closed mode, if there are failures during primary image authentication, the boot ROM turns on the PERSIST\_SECONDARY\_BOOT bit (see [Table 9-8](#)) and performs the software reset. (After the software reset, the secondary image is used.)

## 9.6.8 Serial NOR/EEPROM through LPSPI

The chip supports booting from serial memory devices, such as EEPROM and serial flash, using the LPSPI.

These ports are available for serial boot: LPSPI interfaces.

### 9.6.8.1 Serial NOR/EEPROM eFUSE configuration

The boot ROM code determines the type of device using the following parameters, provided by the eFUSE settings during boot.

**Table 9-35. Serial NOR/EEPROM boot eFUSE descriptions**

Fuse	Config	Definition	GPIO	Shipped value	Settings
EEPROM_RECOVERY_EN(0x6D0[24])	OEM	EEPROM recovery enable	No	0	0 - Disabled 1 - Enabled
LPSPI_PORT_SEL(0x6D0[26:25])	OEM	Port select	No	00	00 - LPSPI1 01 - LPSPI2 10 - LPSPI3 (if applicable in the device) 11 - LPSPI4 (if applicable in the device)
LPSPI_ADDR(0x6D0[27])	OEM	SPI addressing (SPI only)	No	0	0 - 3B (24-bit) 1 - 2B (16-bit)
LPSPI_SPEED(0x6D0[29:28])	OEM	LPSPI Speed select	No	00	00 - 20 MHz 01 - 10 MHz 10 - 5 MHz 11 - 2 MHz

The LPSPI<sub>n</sub> block can be used as a boot device using the LPSPI interface for the serial ROM boot. The SPI interface is configured to operate at speed specified by LPSPI\_SPED\_SEL fuse field.

The boot ROM copies 4 KB of data from the serial ROM device to the internal RAM. After checking the Image Vector Table header value (0xD1) from the program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts the destination pointer and length of image from the Boot Data Structure to be copied to the RAM device from where the code execution occurs.

#### NOTE

The Initial 4 KB of program image must contain the IVT, DCD, and the Boot Data Structures.

## 9.7 Program image

This section describes the data structures that are required to be included in the user's program image. The program image consists of:

- Image vector table—a list of pointers located at a fixed address that the ROM examines to determine where the other components of the program image are located.
- Boot data—a table that indicates the program image location, program image size in bytes, and the plugin flag.
- Device configuration data—IC configuration data.
- User code and data.

### 9.7.1 Image Vector Table and Boot Data

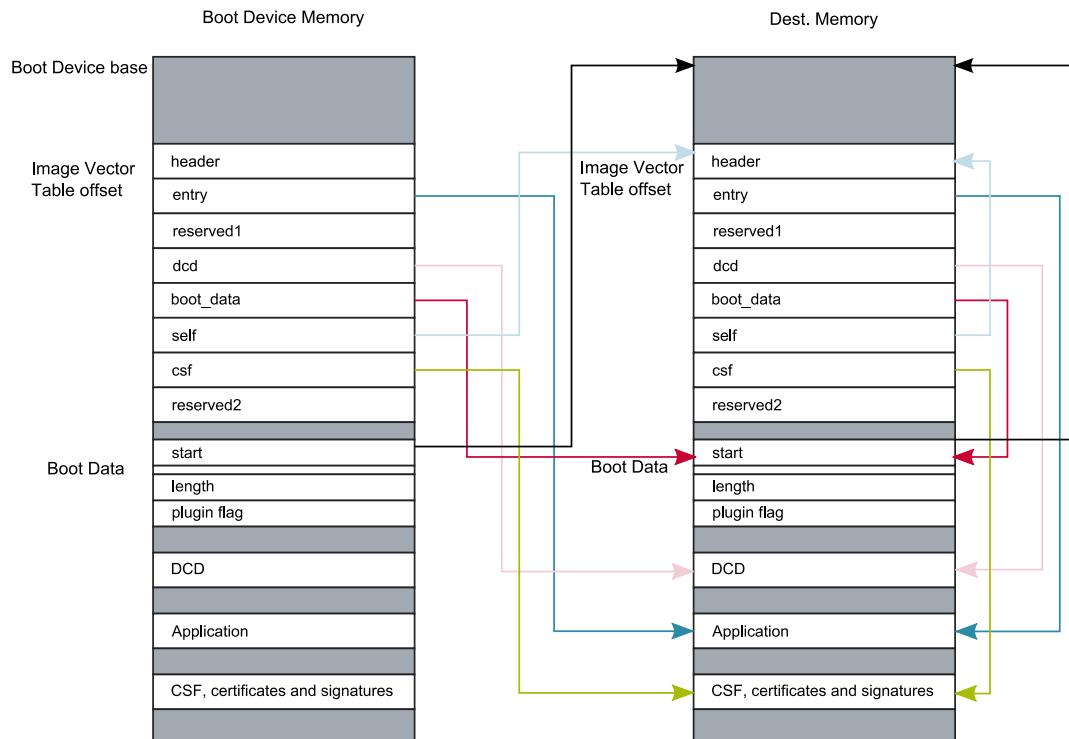

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address for each boot device type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder or the image memory map is flexible and is determined by the contents of the IVT.

**Table 9-36. Image Vector Table Offset and Initial Load Region Size**

Boot Device Type	Image Vector Table Offset
FlexSPI NOR/SEMC NOR	4 Kbyte = 0x1000 bytes
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes
SPI NOR/EEPROM SEMC NAND FlexSPI NAND	1 Kbyte = 0x400 bytes

IVT is at 0x60001000 because Teensy boots from FlexSPI NOR

This figure is rather confusing. It's probably leftover copy-paste from NXP's application processors. For Teensy boot, the "Boot Device Memory" and "Dest. Memory" are the same. They are not different physical memory or different addresses as this figure implies.

**Figure 9-14. Image Vector Table**

### 9.7.1.1 Image vector table structure

The IVT has the following format where each entry is a 32-bit word:

**Table 9-37. IVT format**

header		
entry: Absolute address of the first instruction to execute from the image		LSB=1 for Thumb mode
reserved1: Reserved and should be zero		
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See <a href="#">Device Configuration Data (DCD)</a> for further details on the DCD.		
boot data: Absolute address of the boot data		
self: Absolute address of the IVT. Used internally by the ROM		
csf: Absolute address of the Command Sequence File (CSF) used by the HAB library. See <a href="#">High-Assurance Boot (HAB)</a> for details on the secure boot using HAB. This field must be set to NULL if a CSF is not provided in the image		
reserved2: Reserved and should be zero		

Figure 9-15 shows the IVT header format:

Tag	Length	Version
-----	--------	---------

**Figure 9-15. IVT header format**

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40/0x41

### 9.7.1.2 Boot data structure

The boot data must follow the format defined in the table found here, each entry is a 32-bit word.

**Table 9-38. Boot data format**

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see <a href="#">Plugin image</a> )

### 9.7.2 Device Configuration Data (DCD)

Upon reset, the chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving the optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is a configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various peripherals on the chip.

For example, some components (such as SDRAM) require some sequence of register programming as a part of the configuration before it is ready to be used. The DCD feature can be used to program the SEMC register to the optimal settings.

The ROM determines the location of the DCD table based on the information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big-endian byte array of the allowable DCD commands. The maximum size of the DCD is limited to 1768 B.

Header
[CMD]
[CMD]
...

**Figure 9-16. DCD data format**

The DCD header is 4 B with the following format:

Tag	Length	Version
-----	--------	---------

**Figure 9-17. DCD header format**

where:

Tag: A single-byte field set to 0xD2  
 Length: a two-byte field in the big-endian format containing the overall length of the DCD (in bytes) including the header  
 Version: A single-byte field set to 0x41

### 9.7.2.1 Write data command

The write data command is used to write a list of given 1-, 2- or 4-byte values (or bitmasks) to a corresponding list of target addresses.

The Value/Mask fields are always 32-bits. If the parameter field specifies a smaller size, then the extra bytes must be zero.

The format of the write data command (in a big-endian byte array) is shown in this table:

**Table 9-39. Write data command format**

Tag	Length	Parameter
	Address	
	Value/Mask	
	[Address]	
	[Value/Mask]	

*Table continues on the next page...*

**Table 9-39. Write data command format (continued)**

...
[Address]
[Value/Mask]

where:

Tag: a single-byte field set to 0xCC

Length: a two-byte field in a big-endian format, containing the length of the Write Data Command (in bytes) including the header

Address: the target address to which the data must be written

Value/Mask: the data value (or bitmask) to be written to the preceding address

The parameter field is a single byte divided into bitfields as follows:

**Table 9-40. Write data command parameter field**

7	6	5	4	3	2	1	0
flags						bytes	

where

bytes: the width of the target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only specific bits may be overwritten at the target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes' and flags' parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

**Table 9-41. Interpretation of write data command flags**

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address  = val_msk	Set bitmask

## NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values are larger or any of the bitmasks are wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within the allowed region, none of the values are written. The list of allowable blocks and target addresses for the chip are provided below.

**Table 9-42. Valid DCD address ranges**

Address range	Start address	Last address
IOMUX Control SNVS GPR (IOMUXC_SNVS_GPR)registers	0x400A_4000	0x400A_7FFF
IOMUX Control SNVS (IOMUXC_SNVS)registers	0x400A_8000	0x400A_BFFF
IOMUX Control GPR (IOMUXC_GPR)registers	0x400A_C000	0x400A_FFFF
IOMUX Control (IOMUXC) registers	0x401F_8000	0x401F_BFFF
CCM Analog (ANATOP) registers	0x400D_8000	0x400D_BFFF
CCM registers	0x400F_C000	0x400F_FFFF
SEMC registers	0x402F_0000	0x402F_3FFF

### 9.7.2.2 Check data command

The check data command is used to test for a given 1-, 2-, or 4-byte bitmasks from a source address.

The check data command is a big-endian byte array with the format shown in this table:

**Table 9-43. Check data command format**

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: a single-byte field set to 0xCF

Length: a two-byte field in the big-endian format containing the length of the check data command (in bytes) including the header

Address: the source address to test

Mask: the bit mask to test

Count: an optional poll count; If the count is not specified, this command polls indefinitely until the exit condition is met. If count = 0, this command behaves as for the NOP.

The parameter field is a single byte divided into bitfields, as follows:

**Table 9-44. Check data command parameter field**

7	6	5	4	3	2	1	0
flags				bytes			

where

bytes: the width of target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only the specific bits may be overwritten at a target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

**Table 9-45. Interpretation of check data command flags**

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask)!= mask	Any bit clear
1	1	(*address & mask)!= 0	Any bit set

### NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

### 9.7.2.3 NOP command

This command has no effect.

The format of the NOP command is a big-endian four-byte array, as shown in this table:

**Table 9-46. NOP command format**

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: a single-byte field set to 0xC0

Length: a two-byte field in big endian containing the length of the NOP command in bytes (fixed to a

```
value of 4)
Undefined: this byte is ignored and can be set to any value.
```

## 9.8 Plugin image

The ROM supports a limited number of boot devices. When using other devices as a boot source (for example, Ethernet or USB), the supported boot device must be used (typically serial flash) as a firmware to provide the missing boot drivers. Additionally, the plugin can be customized to support boot drivers, which is more flexible when performing the device initialization, such as condition judging, delay assertion, or to apply custom settings to the boot device and memory system.

In addition to the standard images, the chip also supports plugin images. The plugin images return the execution to the ROM whereas the standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot data structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end, the plugin function must return with the program image parameters. (See [High-level boot sequence](#) for details about the boot flow).

The boot ROM authenticates the plugin image before running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32
*ivt_offset);
```

**ARGUMENTS PASSED:**

- start - the image load address on exit.
- bytes - the image size on exit.
- ivt\_offset - the offset (in bytes) of the IVT from the image start address on exit.

**RETURN VALUE:**

- 1 - success
- 0 - failure

## 9.9 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB and UART serial connection.

In this mode, the ROM programs the WDOG1 for a time-out specified by the fuse WDOG Time-out Select (See the Fusemap chapter for details) if the WDOG\_ENABLE eFuse is 1 and continuously polls for the USB and UART connection. If no activity is found on the USB OTG1 and UART and the watchdog timer expires, the Arm core is reset.

**NOTE**

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB and UART boot flow:

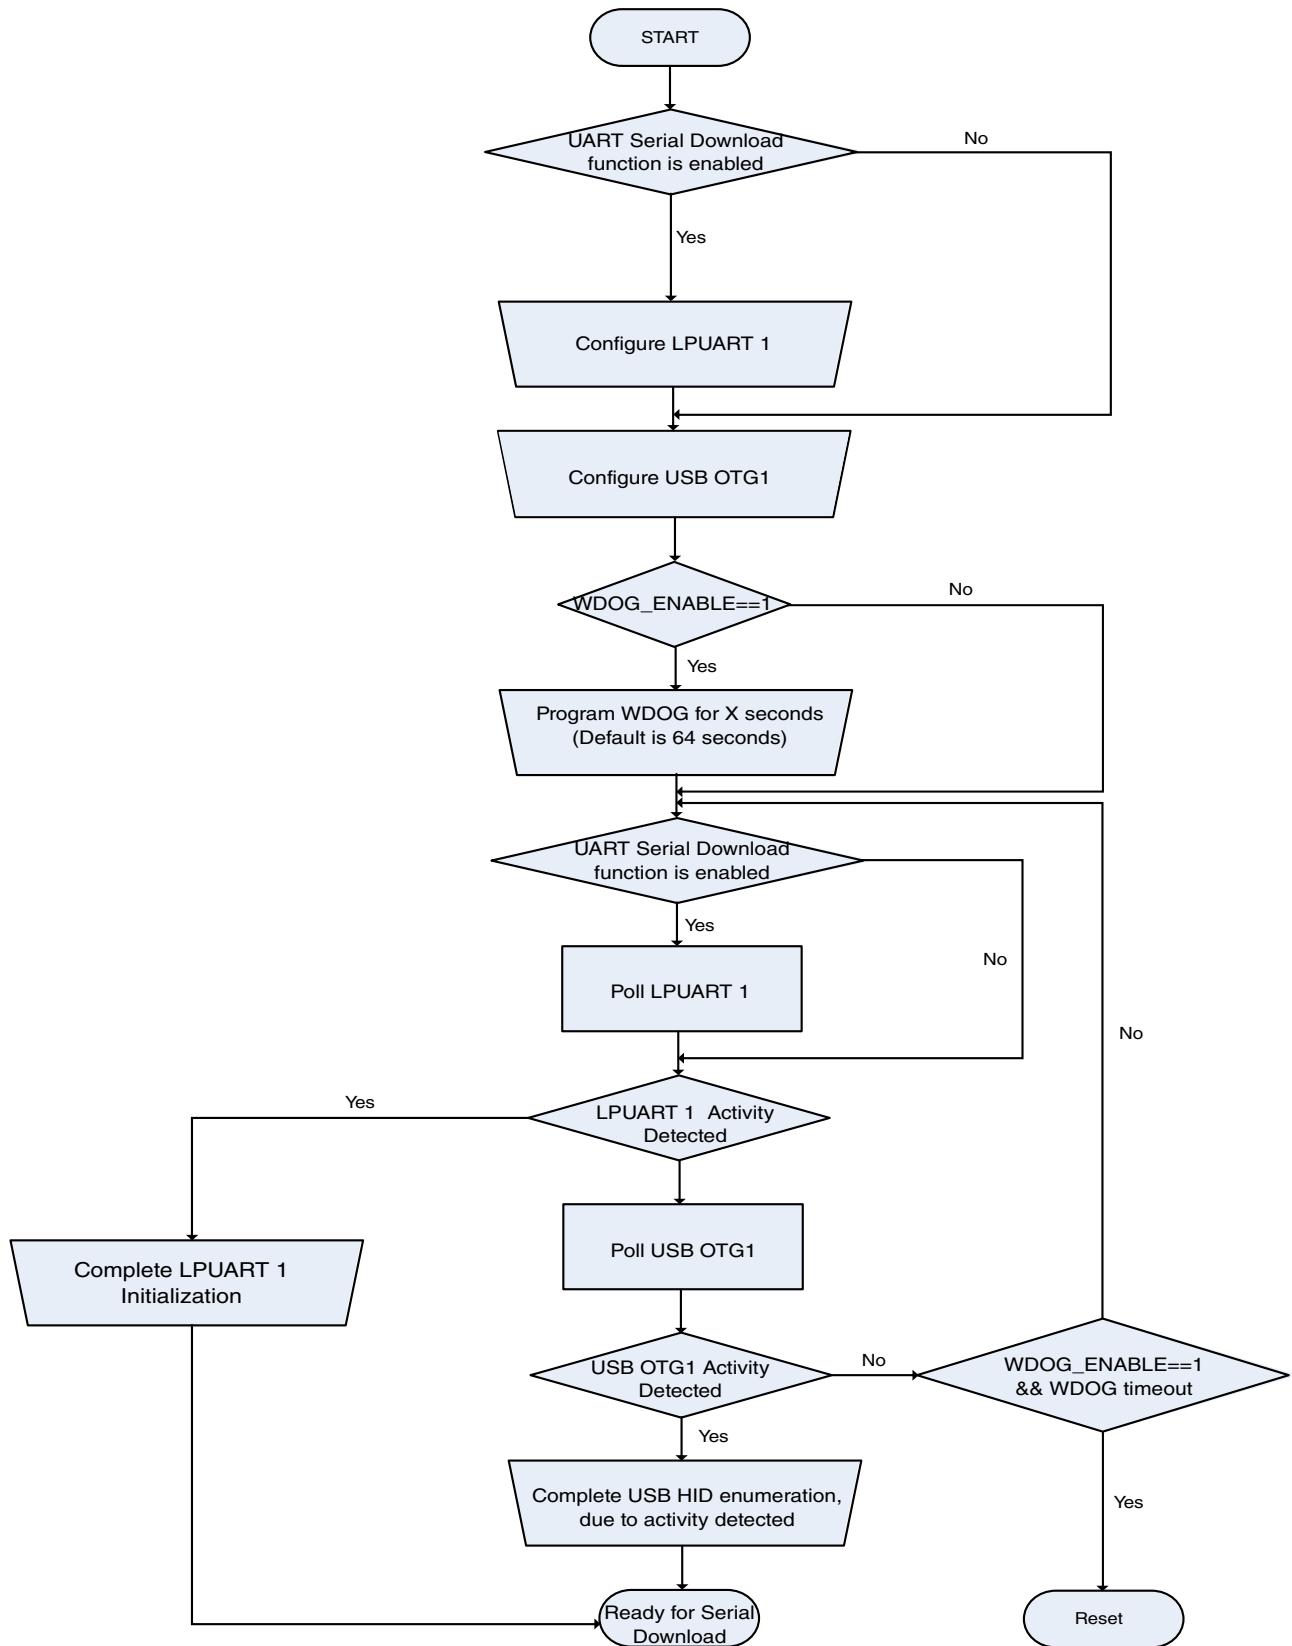

Figure 9-18. Serial Downloader boot flow

## 9.9.1 USB

The USB support is composed of the USB1 (USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB1 port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of four HID reports are used to implement the SDP protocol for data transfers, as described in [Table 9-47](#).

**Table 9-47. USB HID reports**

Report ID (first byte)	Transfer endpoint	Direction	Length	Description
1	control OUT	Host to device	17 B	SDP command from the host to the device.
2	control OUT	Host to device	Up to 1025 B	Data associated with the report 1 SDP command.
3	interrupt	Device to host	5 B	HAB security configuration. The device sends 0x12343412 in the closed mode and 0x56787856 in the open mode.
4	interrupt	Device to host	Up to 65 B	Data in response to the SDP command in report 1.

### 9.9.1.1 USB configuration details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for the USB device driver are listed in the following table.

**Table 9-48. VID/PID and strings for USB device driver**

Descriptor	Value
VID	0x1FC9 (NXP vendor ID)
PID <sup>1</sup>	0x0135
String Descriptor1 (manufacturer)	NXP Semiconductors
String Descriptor2 (product)	S Blank

*Table continues on the next page...*

**Table 9-48. VID/PID and strings for USB device driver (continued)**

Descriptor	Value
String Descriptor4	NXP Flash
String Descriptor5	NXP Flash

1. Allocation based on the BPN (Before Part Number)

### 9.9.1.2 IOMUX configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses the dedicated contacts on the IC. See the chip data sheet for details.

### 9.9.2 Serial Download Protocol (SDP)

The 16-byte SDP command from the host to device is sent using the HID report 1. This table describes the 16-byte SDP command data structure:

**Table 9-49. 16-byte SDP command data structure**

BYTE offset	Size	Name	Description
0	2	COMMAND TYPE	<p>These commands are supported for the ROM:</p> <ul style="list-style-type: none"> <li>• 0x0101 READ_REGISTER</li> <li>• 0x0202 WRITE_REGISTER</li> <li>• 0x0404 WRITE_FILE</li> <li>• 0x0505 ERROR_STATUS</li> <li>• 0xA0A DCD_WRITE</li> <li>• 0xB0B JUMP_ADDRESS</li> <li>• 0xD0D SET_BAUDRATE (only applicable to UART)</li> </ul>
2	4	ADDRESS	<p>Only relevant for these commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS.</p> <p>For the READ_REGISTER and WRITE_REGISTER commands, this field is the address to a register. For the WRITE_FILE and JUMP_ADDRESS commands, this field is an address to the internal or external memory address.</p> <p><b>NOTE:</b> For SET_BAUDRATE command, this word is the baudrate value in big-endian format.</p>
6	1	FORMAT	Format of access, 0x8 for an 8-bit access, 0x10 for a 16-bit access, and 0x20 for a 32-bit access. Only relevant for the READ_REGISTER and WRITE_REGISTER commands.

*Table continues on the next page...*

**Table 9-49. 16-byte SDP command data structure (continued)**

BYTE offset	Size	Name	Description
7	4	DATA COUNT	Size of the data to read or write in bytes. Only relevant for the WRITE_FILE, READ_REGISTER, WRITE_REGISTER, and DCD_WRITE commands. For the WRITE_FILE and DCD_WRITE commands, the DATA COUNT is in the byte units.
11	4	DATA	The value to write. Only relevant for the WRITE_REGISTER command.
15	1	RESERVED	Reserved

### 9.9.2.1 SDP commands

The SDP commands are described in the following sections.

#### 9.9.2.1.1 READ\_REGISTER

The transaction for the READ\_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration, and Report4 for the response or the register value.

The register to read is specified in the ADDRESS field of the SDP command. The first device sends Report3 with the security configuration followed by the Report4 with the bytes read at a given address. If the count is greater than 64, multiple reports with the report id 4 are sent until the entire data requested by the host is sent. The STATUS is either 0x12343412 for the closed parts and 0x56787856 for the open or field return parts.

Report1, Command, Host to Device:

1	Valid values for the READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register value
---	----------------

ID 4 bytes of data containing the register value. If the number of bytes requested is less than 4, the remaining bytes must be ignored by the host.

Multiple reports of the report id 4 are sent until the entire requested data is sent.

Report4, Response, Device to Host: last response report

4	Register value
---	----------------

ID 64 bytes of data containing the register value. If the number of bytes requested is less than 64, the remaining bytes must be ignored by the host.

### 9.9.2.1.2 WRITE\_REGISTER

The transaction for the WRITE\_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration and Report4 for the write status.

The host sends Report1 with the WRITE\_REGISTER command. The register to write is specified in the ADDRESS field of the SDP command of Report1, with the FORMAT field set to the data type (number of bits to write, either 8, 16, or 32) and the value to write in the DATA field of the SDP command. The device writes the DATA to the register address and returns the WRITE\_COMPLETE code using Report4 and the security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	4 bytes indicating the security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with the first 4 bytes to indicate that the write is completed with code 0x128A8A12. On failure, the device reports the HAB error status.

### 9.9.2.1.3 WRITE\_FILE

The transaction for the WRITE\_FILE command consists of these reports: Report1 for the command phase, Report2 for the data phase, Report3 for the HAB mode, and Report4 to indicate that the data are received in full.

The size of each Report2 is limited to 1024 bytes (limitation of the USB HID protocol). Hence, multiple Report2 packets are sent by the host in the data phase until the entire data is transferred to the device. When the entire data (DATA\_COUNT bytes) is received, the device sends Report3 with the HAB mode and Report4 with 0x88888888, indicating that the file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP command

=====Optional Begin=====

Host sends the ERROR\_STATUS command to query if the HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with the first four bytes to indicate that the file download completed with code 0x88888888. On failure, the device reports the HAB error status.

#### 9.9.2.1.4 ERROR\_STATUS

The transaction for the SDP command ERROR\_STATUS consists of three reports.

Report1 is used by the host to send the command; the device sends global error status in four bytes of Report4 after returning the security configuration in Report3. When the device receives the ERROR\_STATUS command, it returns the global error status that is updated for each command. This command is useful to find out whether the last command resulted in a device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	Four bytes Error status
---	-------------------------

ID first 4 bytes status in 64 bytes Report4

#### 9.9.2.1.5 DCD\_WRITE

The SDP command DCD\_WRITE is used by the host to send multiple register writes in one shot. This command is provided to speed up the process of programming the register writes (such as to configure an external RAM device).

The command goes with Report1 from the host with COMMAND TYPE set to DCD\_WRITE, ADDRESS which is used as a temporary location of the DCD data, and DATA\_COUNT to the number of bytes sent in the data out phase. In the data phase, the

## Serial Downloader

host sends the data for a number of registers using Report2. The device completes the transaction with Report3 indicating the security configuration and Report4 with the WRITE\_COMPLETE code 0x128A8A12.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with the first four bytes to indicate that the write completed with the code 0x128A8A12. On failure, the device reports the HAB error status.

See [Device Configuration Data \(DCD\)](#) for the DCD format description.

### 9.9.2.1.6 JUMP\_ADDRESS

The SDP command JUMP\_ADDRESS is the last command that the host can send to the device. After this command, the device jumps to the address specified in the ADDRESS field of the SDP command and starts to execute. **It actually expects the IVT address**

This command usually follows after the WRITE\_FILE command. The command is sent by the host in the command-phase of the transaction using Report1. There is no data phase for this command, but the device sends the status Report3 to complete the transaction. If the authentication fails, it also sends Report4 with the HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

This report is sent by the device only in case of an error jumping to the given address, or if the device reports error in Report4, Response, Device to Host:

4	Four bytes HAB error status
---	-----------------------------

ID 4 bytes status, 64 bytes report length

### 9.9.2.1.7 SET\_BAUDRATE

The SDP command SET\_BAUDRATE is used by the host to configure the UART baudrate on the device side. The default baudrate is 115200.

The transaction for SET\_BAUDRATE command consists of 2 stages.

Stage 1, Command, Host to Device:

Byte 0	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6 to 15
0x0d	0xd0	baudrate [31:24]	baudrate [23:16]	baudrate [15:8]	baudrate [7:0]	All 0x00

Stage 2, Response, Device to Host:

Byte 0	Byte 1	Byte 2	Byte 3
0x09	0xd0	0x0d	0x90

After receiving the Response, the host needs to wait about 100 µs until the device is ready for accepting a new command using the specified baudrate.

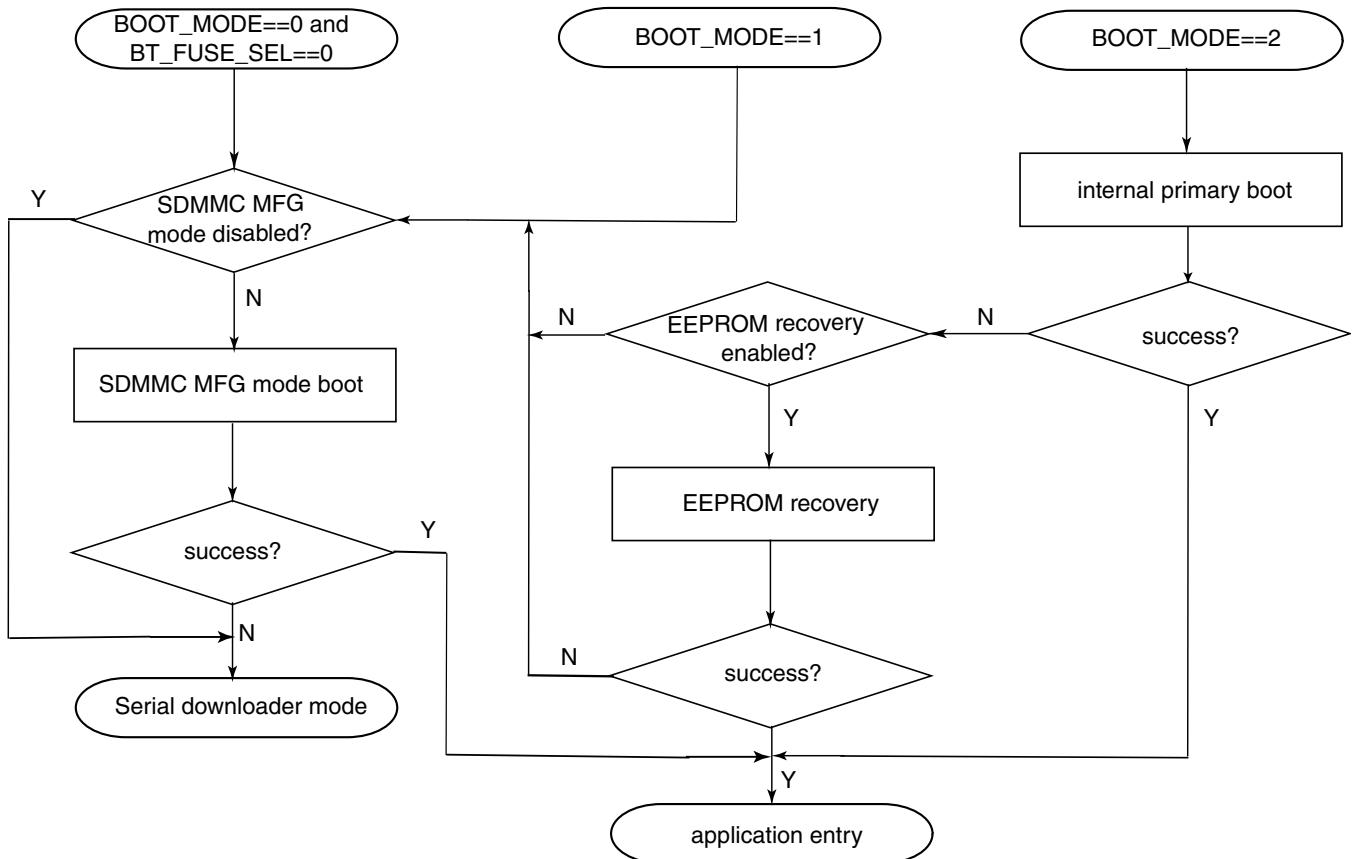

## 9.10 Recovery devices

The chip supports recovery devices. If the primary boot device fails, the boot ROM tries to boot from the recovery device using one of the LPSPI ports.

To enable the recovery device, the recovery boot fuse must be set. Additionally, the serial EEPROM fuses must be set as described in [Serial NOR/EEPROM through LPSPI](#).

## 9.11 SD/MMC manufacture mode

When the internal boot and recover boot (if enabled) failed, the boot goes to the SD/MMC manufacture mode before the serial download mode. In the manufacture mode, one bit bus width is used despite of the fuse setting.

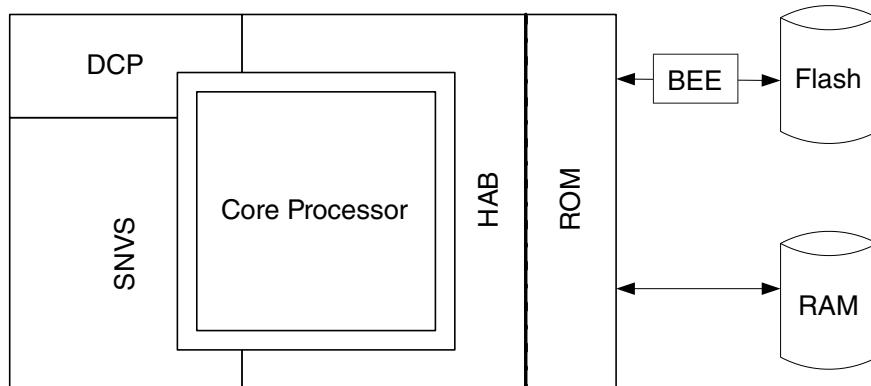

**Figure 9-19. SD/MMC manufacture boot flow**

## 9.12 High-Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying the areas of code or data in the programmable memory to make it behave in an incorrect manner. The HAB also prevents the attempts to gain access to features which must not be available.

The integration of the HAB feature with the ROM code ensures that the chip does not enter an operational state if the existing hardware security blocks detected a condition that may be a security threat or if the areas of memory deemed to be important were modified. The HAB uses the RSA digital signatures to enforce these policies.

**Figure 9-20. Secure boot components**

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to make sure that the system security state is as expected. The HAB also uses the hardware block to accelerate the SHA-256 message digest operations performed during the signature verifications. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The supported RSA key sizes are 1024, 2048, 3072, and 4096 bits. The main features supported by the HAB are:

- X.509 public key certificate support
- CMS signature format support

### NOTE

NXP provides the reference Code Signing Tool (CST) for key generation and code signing for use with the HAB library. The

CST can be found by searching for "IMX\_CST\_TOOL" at  
<http://www.nxp.com>

### 9.12.1 HAB API vector table addresses

For devices that perform a secure boot, the HAB library may be called by the boot stages that execute after the ROM code.

The HAB API vector table for this device is at address 0x0020\_0300 .

## 9.13 ROM APIs

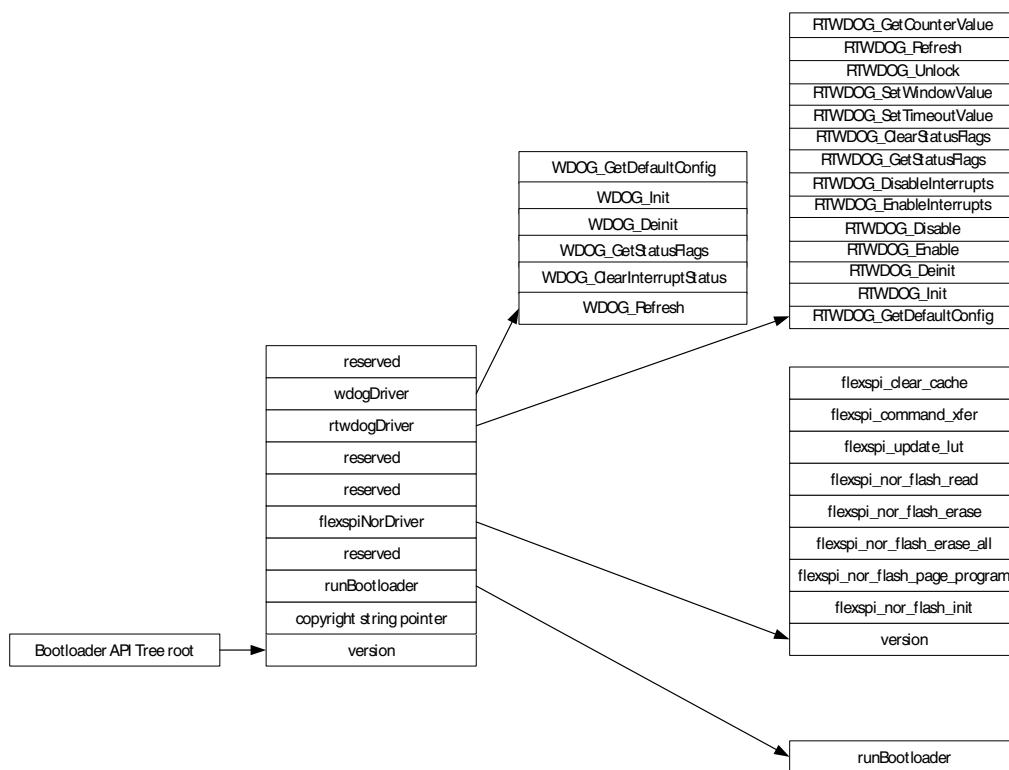

### 9.13.1 Introduction

The ROM bootloader provides a set of ROM APIs to simplify the In-Application Programming (IAP) and WDOG operation.

The ROM bootloader supports the following APIs:

- runBootloader API
- FlexSPI NOR Flash Driver API
- RTWDOG Driver API
- WDOG Driver API

The ROM API root pointer is located at address 0x0020\_001c . See the following figure for details of the ROM API layout.

**Figure 9-21. ROM API Structure**

The ROM API structure definitions are as below:

### 1. RTWDOG driver API structure

```
typedef struct
{
    void (*RTWDOG_GetDefaultConfig) (rtwdog_config_t *config);
    void (*RTWDOG_Init) (RTWDOG_Type *base, const rtwdog_config_t *config);
    void (*RTWDOG_Deinit) (RTWDOG_Type *base);
    void (*RTWDOG_Enable) (RTWDOG_Type *base);
    void (*RTWDOG_Disable) (RTWDOG_Type *base);
    void (*RTWDOG_EnableInterrupts) (RTWDOG_Type *base, uint32_t mask);
    void (*RTWDOG_DisableInterrupts) (RTWDOG_Type *base, uint32_t mask);
    uint32_t (*RTWDOG_GetStatusFlags) (RTWDOG_Type *base);
    void (*RTWDOG_ClearStatusFlags) (RTWDOG_Type *base, uint32_t mask);
    void (*RTWDOG_SetTimeoutValue) (RTWDOG_Type *base, uint16_t timeoutCount);
    void (*RTWDOG_SetWindowValue) (RTWDOG_Type *base, uint16_t windowValue);
    void (*RTWDOG_Unlock) (RTWDOG_Type *base);
    void (*RTWDOG_Refresh) (RTWDOG_Type *base);
    uint16_t (*RTWDOG_GetCounterValue) (RTWDOG_Type *base);
} rtwdog_driver_interface_t;
```

### 2. WDOG driver API structure

```
typedef struct
{
    void (*WDOG_GetDefaultConfig) (wdog_config_t *config);
    void (*WDOG_Init) (WDOG_Type *base, const wdog_config_t *config);
    void (*WDOG_Deinit) (WDOG_Type *base);
    void (*WDOG_Enable) (WDOG_Type *base);
    void (*WDOG_Disable) (WDOG_Type *base);
    void (*WDOG_EnableInterrupts) (WDOG_Type *base, uint16_t mask);
    uint16_t (*WDOG_GetStatusFlags) (WDOG_Type *base);
```

```

void (*WDOG_ClearInterruptStatus) (WDOG_Type *base, uint16_t mask);
void (*WDOG_SetTimeoutValue) (WDOG_Type *base, uint16_t timeoutCount);
void (*WDOG_SetInterruptTimeoutValue) (WDOG_Type *base, uint16_t timeoutCount);
void (*WDOG_DisablePowerDownEnable) (WDOG_Type *base);
void (*WDOG_Refresh) (WDOG_Type *base);
} wdog_driver_interface_t;

```

### 3. Bootloader API Entry Structure

```

typedef struct
{
    const uint32_t version;                                //!<< Bootloader version
    number
    const char *copyright;                                //!<< Bootloader Copyright
    void (*runBootloader)(void *arg);                      //!<< Function to start the
    bootloader executing
    const uint32_t *reserved0;                            //!<< Reserved
    const flexspi_nor_driver_interface_t *flexSpiNorDriver; //!<< FlexSPI NOR Flash API
    const uint32_t *reserved1;                            //!<< Reserved
    const rtwdog_driver_interface_t *rtwdogDriver;
    const wdog_driver_interface_t *wdogDriver;
    const uint32_t *reserved2;
} bootloader_api_entry_t;
#define g_bootloaderTree ((bootloader_api_entry_t*)(0x0020001c))

```

### 4. FlexSPI NOR Driver API structure

```

typedef struct
{
    uint32_t version;
    status_t (*init)(uint32_t instance, flexspi_nor_config_t *config);
    status_t (*program)(uint32_t instance, flexspi_nor_config_t *config, uint32_t
dst_addr, const uint32_t *src);
    status_t (*erase_all)(uint32_t instance, flexspi_nor_config_t *config);
    status_t (*erase)(uint32_t instance, flexspi_nor_config_t *config, uint32_t start,
uint32_t lengthInBytes);
    status_t (*read)(
        uint32_t instance, flexspi_nor_config_t *config, uint32_t *dst, uint32_t addr,
        uint32_t lengthInBytes);
    void (*clear_cache)(uint32_t instance);
    status_t (*xfer)(uint32_t instance, flexspi_xfer_t *xfer);
    status_t (*update_lut)(uint32_t instance, uint32_t seqIndex, const uint32_t
*lutBase, uint32_t seqNumber);
    status_t (*get_config)(uint32_t instance, flexspi_nor_config_t *config,
serial_nor_config_option_t *option);
} flexspi_nor_driver_interface_t;

```

## 9.13.2 FlexSPI NOR APIs

The ROM bootloader provides a set of Serial NOR FLASH API to simplify the external FLASH enablement on this RT chip. The version of the FlexSPI NOR API in this RT ROM bootloader is version 1.5.0 .

- See the API structure shown in section "FlexSPI NOR Driver API structure"
- See the possible status codes listed in section "Status codes for the FlexSPI NOR API"
- See the flexspi\_nor\_config\_t defined in table "Serial NOR configuration block"

**NOTE**

1. The ROM API sets the FlexSPI clock root source to PFD480\_PFD0 and sets the FLASH read frequency based on the field "serialClkFreq." The "serialClkFreq" and "ipcmdSerialClkFreq" must be set to 0 if the user application selects a different FlexSPI clock root source.
2. The ROM API dynamically changes the FLASH serial root clock for all the non-READ commands according to the "ipcmdSerialClkFreq" field if it is non-zero. This design helps avoid potential FLASH timing issues because some FLASH devices cannot support the program/erase operation at the same frequency as the read operation. This field can be set to 0 if the dynamic clock switch is unnecessary on the chosen FLASH device.
3. The user application must ensure that there is no FLASH access from any masters (for example, Cortex-M7, USB, PXP) during the FLASH erase/program if the FLASH device doesn't support Read-While-Write (RWW) feature. Otherwise, the behavior is unpredictable.
4. The user application should disable the global interrupt during the FLASH erase/program if the code is executing on the NOR FLASH, and the FLASH device doesn't support the RWW feature. Otherwise, the behavior is unpredictable.

***FlexSPI NOR prototypes*****1. flexspi\_nor\_flash\_init**

Initialize the Serial NOR device via FLEXSPI

```
status_t flexspi_nor_flash_init(uint32_t instance, flexspi_nor_config_t *config)
{
    return g_bootloaderTree->flexSpiNorDriver->init(instance, config);
}
```

See example code in section "FLASH API example on this RT device EVK board".

**2. flexspi\_nor\_flash\_page\_program**

Program data to specified Flash address

```
status_t flexspi_nor_flash_page_program(uint32_t instance, flexspi_nor_config_t
*config, uint32_t dstAddr, const uint32_t *src)
{
    return g_bootloaderTree->flexSpiNorDriver->program(instance, config, dstAddr, src);
}
```

See example code in section "FLASH API example on this RT device EVK board".

### 3. flexspi\_nor\_flash\_erase\_all

Erase the whole Flash array via FLEXSPI

```
status_t flexspi_nor_flash_erase_all(uint32_t instance, flexspi_nor_config_t *config)
{
    return g_bootloaderTree->flexSpiNorDriver->erase_all(instance, config);
}
```

Example code:

```
flexspi_nor_flash_erase_all(0, config);
```

### 4. flexspi\_nor\_get\_config

Get the Flash configuration block via the serial\_nor\_config\_option\_t block, see section "serial\_nor\_config\_t definition".

```
status_t flexspi_nor_get_config(uint32_t instance, flexspi_nor_config_t *config,
serial_nor_config_option_t *option)
{
    return g_bootloaderTree->flexSpiNorDriver->get_config(instance, config, option);
}
```

See example code in section "FLASH API example on this RT device EVK board".

### 5. flexspi\_nor\_flash\_erase

Erase specified Flash region, the minimum erase unit is one sector.

```
status_t flexspi_nor_flash_erase(uint32_t instance, flexspi_nor_config_t *config,
uint32_t start, uint32_t length)
{
    return g_bootloaderTree->flexSpiNorDriver->erase(instance, config, start, length);
}
```

See example code in section "FLASH API example on this RT device EVK board".

### 6. flexspi\_nor\_flash\_read

Read the FLASH via FLEXSPI using IP read command

```
status_t flexspi_nor_flash_read(uint32_t instance, flexspi_nor_config_t *config,
uint32_t *dst, uint32_t start, uint32_t bytes)
{
    return g_bootloaderTree->flexSpiNorDriver->read(instance, config, dst, start,
bytes);
}
```

Example code:

```
uint32_t pageBuffer[256/sizeof(uint32_t)];
flexspi_nor_flash_read(0, config, pageBuffer, 0, sizeof(pageBuffer));
```

### 7. flexspi\_update\_lut

Update the specified LUT entries

```
status_t flexspi_update_lut(uint32_t instance, uint32_t seqIndex, const uint32_t
*lutBase, uint32_t numberOfSeq)
{
```

```

        return g_bootloaderTree->flexSpiNorDriver->update_lut(instance, seqIndex, lutBase,
numberOfSeq);
}

```

Example code:

```

uint32_t chipEraseLUT[4] = {0x0460, 0, 0, 0};
flexspi_update_lut(0, 1, chipEraseLUT, 1);

```

## 8. flexspi\_command\_xfer

Execute LUT sequence specified by xfer

```

status_t flexspi_command_xfer(uint32_t instance, flexspi_xfer_t *xfer)
{
    return g_bootloaderTree->flexSpiNorDriver->xfer(instance, xfer);
}

```

flexspi\_xfer\_t definition is as below:

```

//!@brief FlexSPI Transfer Context
typedef struct _FlexSpiXfer
{
    flexspi_operation_t operation; //!< FlexSPI operation
    uint32_t baseAddress; //!< FlexSPI operation base address
    uint32_t seqId; //!< Sequence Id
    uint32_t seqNum; //!< Sequence Number
    bool isParallelModeEnable; //!< Is a parallel transfer
    uint32_t *txBuffer; //!< Tx buffer
    uint32_t txSize; //!< Tx size in bytes
    uint32_t *rxBuffer; //!< Rx buffer
    uint32_t rxSize; //!< Rx size in bytes
} flexspi_xfer_t;

```

flexspi\_operation\_t definition is as below:

```

typedef enum _FlexSPIOperationType
{
    kFlexSpiOperation_Command, //!< FlexSPI operation: Only command, both TX and
    //! RX buffer are ignored.
    kFlexSpiOperation_Config, //!< FlexSPI operation: Configure device mode, the
    //! TX FIFO size is fixed in LUT.
    kFlexSpiOperation_Write, //!< FlexSPI operation: Write, only TX buffer is
    //! effective
    kFlexSpiOperation_Read, //!< FlexSPI operation: Read, only Rx Buffer is
    //! effective.
    kFlexSpiOperation_End = kFlexSpiOperation_Read,
} flexspi_operation_t;

```

Example code, assuming the LUT index 1 is the Flash WriteEnable command.

```

flexspi_xfer_t flashXfer =
{
    kFlexSpiOperation_Command, 0, 1, 1, false, NULL, 0, NULL, 0
};
flexspi_command_xfer(0, &flashXfer);

```

## 9. flexspi\_clear\_cache

Clear the AHB buffer in FLEXSPI module.

```

void flexspi_clear_cache(uint32_t instance)
{
    g_bootloaderTree->flexSpiNorDriver->clear_cache(instance);
}

```

Example code:

```
flexspi_clear_cache(0);
```

## 10. serial\_nor\_config\_t definition

serial\_nor\_config\_t is defined as below.

```
typedef struct _serial_nor_config_option
{
    union
    {
        struct
        {
            uint32_t max_freq : 4;           //!< Maximum supported Frequency
            uint32_t misc_mode : 4;         //!< miscellaneous mode
            uint32_t quad_mode_setting : 4; //!< Quad mode setting
            uint32_t cmd_pads : 4;          //!< Command pads
            uint32_t query_pads : 4;        //!< SFDP read pads
            uint32_t device_type : 4;       //!< Device type
            uint32_t option_size : 4;        //!< Option size, in terms of uint32_t,
size = (option_size + 1) * 4
            uint32_t tag : 4;              //!< Tag, must be 0x0E
        } B;
        uint32_t U;
    } option0;

    union
    {
        struct
        {
            uint32_t dummy_cycles : 8;      //!< Dummy cycles before read
            uint32_t reserved0 : 8;         //!< Reserved for future use
            uint32_t pinmux_group : 4;      //!< The pinmux group selection
            uint32_t reserved1 : 8;         //!< Reserved for future use
            uint32_t flash_connection : 4; //!< Flash connection option: 0 - Single
Flash connected to port A
        } B;
        uint32_t U;
    } option1;
} serial_nor_config_option_t;
```

Detailed information of serial\_nor\_config\_option\_t structure is shown in the following table.

**Table 9-50. serial\_nor\_config\_option\_t definition**

Offset	Field	Description
0	Option0	See option0 definition for more details
4	Option1	Optional, effective only if the Option Size field in Option0 is non-zero See option1 definition for more details.

**Table 9-51. Option0 definition**

Field	Bits	Description
tag	31:28	The tag of the config option, fixed to 0x0C
option_size	27:24	Size in bytes = (Option Size + 1) × 4

*Table continues on the next page...*

**Table 9-51. Option0 definition  
(continued)**

		It is 0 if only option0 is required
device_type	23:20	<p>Device Detection Type</p> <p>0 - Read SFDP for SDR commands</p> <p>1 - Read SFDP for DDR Read commands</p> <p>2 - HyperFLASH 1V8</p> <p>3 - HyperFLASH 3V</p> <p>4 - Macronix Octal DDR</p> <p>6 - Micron Octal DDR</p> <p>8 - Adesto EcoXiP DDR</p>
query_pad	19:16	<p>Data pads during Query command (read SFDP or read MID)</p> <p>0 - 1</p> <p>2 - 4</p> <p>3 – 8</p>
cmd_pad	15:12	<p>Data pads during Flash access command</p> <p>0 - 1</p> <p>2 - 4</p> <p>3 – 8</p>
quad_mode_setting	11:8	<p>Quad Mode Enable Setting</p> <p>0 - Not configure</p> <p>1 - Set bit 6 in Status Register 1</p> <p>2 - Set bit 1 in Status Register 2</p> <p>3 - Set bit 7 in Status Register 2</p> <p>4 - Set bit 1 in Status Register 2 via 0x31 command</p> <p><b>NOTE:</b> This field will be effective only if device is compliant with JESD216 only (9 longword SDFP table).</p>
misc_mode	7:4	<p>Miscellaneous Mode</p> <p>0 - Not enabled</p> <p>1 - Enable 0-4-4 mode for High Random Read performance</p> <p>3 - Data Order Swapped mode (for MXIC OctaFlash only)</p> <p><b>NOTE:</b> Experimental feature, do not use in products, keep it as 0.</p>
max_freq	3:0	<p>Max Flash Operation speed</p> <p>0 - Don't change FlexSPI clock setting</p> <p>Others - See System Boot chapter for more details.</p>

**Table 9-51. Option0 definition**

		<b>NOTE:</b>	The field has a restriction that the FlexSPI clock source must be PLL480_PFD0, keep it as 0 and manually configure the FLEXSPI clock if another clock source is selected in user application.
--	--	--------------	---

**Table 9-52. Option1 definition**

Field	Bits	Description
flash_connectio n	31:28	Flash connection selection 0 - Only Port A
reserved	27:20	Reserved
pin_group	19:16	PinMux group 0 - Primary pin group 1 - Secondary pin group
reserved	15:8	Reserved for future use
dummy_cycles	7:0	Dummy cycles for read command 0 - Use detected dummy cycle Others - dummy cycles provided in flash data sheet

**NOTE**

- a. These APIs only support 1 single FLASH device connected to PORTA and FLEXSPIA\_SS0 .
- b. Parallel mode is **NOT** supported.
- c. The APIs always use 30 MHz clock for the programming option. Users need to change the "ipcmdSerialClkFreq" field in flexspi\_nor\_config\_t field after flexspi\_nor\_get\_config option if a higher programming speed is expected.
- d. User application needs to set "max\_freq" to 0 and manually configure the FLEXSPI clock prior to calling the flexspi\_nor\_get\_config API, if the expected FLEXSPI clock source is not the default clock source configured by the ROM bootloader.

- e. The pad drive strength is configured to "R0/6" (See IOMUXC chapter for more details). Users can change the "dataPadOverride" and "sclkPadOverride" setting in `flexspi_nor_config_t` structure after calling `flexspi_nor_get_config` if it is necessary.

## 11. Status codes for the FlexSPI NOR API

The following table lists all the error and status codes for the FlexSPI NOR API.

**Table 9-53. Status and error codes for the FlexSPI NOR API**

Status	Code	Description
kStatus_Success	0	Operation succeeded without error
kStatus_Fail	1	Operation failed with a generic error
kStatus_InvalidArgument	4	The requested argument is invalid
kStatus_Timeout	5	A timeout occurred
kStatus_FLEXSPI_SequenceExecutionTimeout	7000	The command timed out
kStatus_FLEXSPI_InvalidSequence	7001	Invalid LUT sequence
kStatus_FLEXSPI_DeviceTimeout	7002	The busy time exceeded provided timeout value
kStatus_FLEXSPINOR_ProgramFail	20100	Program Command failed
kStatus_FLEXSPINOR_EraseSectorFail	20101	Erase sector command failed
kStatus_FLEXSPINOR_EraseAllFail	20102	Erase All command failed
kStatus_FLEXSPINOR_WaitTimeout	20103	The wait time exceeded provided timeout value
kStatus_FlexSPINOR_NotSupported	20104	The operation is not supported
kStatus_FlexSPINOR_WriteAlignmentError	20105	Write address is unaligned to page size
kStatus_FlexSPINOR_CommandFailure	20106	Command failed
kStatus_FlexSPINOR_SFDP_NotFound	20107	SFDP table was not found, used for <code>flexspi_nor_flash_get_config</code> API
kStatus_FLEXSPINOR_Flash_NotFound	20109	Cannot detect a FLASH device
kStatus_FLEXSPINOR_DTRRead_DummyProbeFailed	20110	The dummy cycle for DDR/DTR read cannot be probed.

The following list provides typical market options for the serial NOR flash devices.

- QuadSPI NOR - Quad SDR Read: option0 = 0xc0000008 (133MHz)
- QuadSPI NOR - Quad DDR Read: option0 = 0xc0100003 (60MHz)
- HyperFLASH 1V8: option0 = 0xc0233009 (166MHz)
- HyperFLASH 3V0: option0 = 0xc0333006 (100MHz)
- MXIC OPI DDR (OPI DDR enabled by default): option=0xc0433008(133MHz)
- Micron Octal DDR: option0=0xc0600006 (100MHz)

- Micron OPI DDR: option0=0xc0603008 (133MHz), SPI->OPI DDR
- Micron OPI DDR (DDR read enabled by default): option0 = 0xc0633008 (133MHz)
- Adesto OPI DDR: option0=0xc0803008(133MHz)

The following is a typical use case of the FlexSPI NOR API.

```

flexspi_nor_config_t config;
serial_nor_config_option_t option;
status_t status;
uint32_t address = 0x40000; // 256KB
uint32_t sector_size = 0x1000; // 4KB
uint32_t page_buffer[256/ sizeof(uint32_t)];
uint32_t instance = 0;

option.option0.U = 0xC0000008; // QuadSPI NOR, Frequency: 133MHz

status = flexspi_nor_get_config(instance, &config, &option);
if (status != kStatus_Success)
{
    return status;
}

status = flexspi_nor_flash_init(instance, &config);
if (status != kStatus_Success)
{
    return status;
}

status = flexspi_nor_flash_erase(instance, &config, address, sector_size); // Erase 1
sector
if (status != kStatus_Success)
{
    return status;
}

// Fill data into the page_buffer;
for (uint32_t i=0; i<sizeof(page_buffer)/sizeof(page_buffer[0]); i++)
{
    page_buffer[i] = (i << 24) | (i << 16) | (i << 8) | i;
}
// Program data to destination
status = flexspi_nor_flash_page_program(instance, &config, address, page_buffer); // program
1 page
if (status != kStatus_Success)
{
    return status;
}

// Do cache maintenance here if the D-Cache is enabled
// Use memory mapped access to verify whether data are programmed into Flash correctly
uint32_t mem_address = 0x6000_0000 + address;
if (0 == memcmp((void*)mem_address, page_buffer, sizeof(page_buffer)))
{
    // Success
}
else
{
    // Report error
}

```

### 9.13.3 Enter Bootloader API

The ROM bootloader provides an API for the user application to boot from a new updated application safely after In-Application Programming (IAP) or re-enter serial downloader mode for image update. See more details in the next section.

#### *API prototype*

```
void runBootloader(void* arg)
{
    g_bootloaderTree-> runBootloader(arg);
}
```

#### *ARG definition*

Field	Offset	Description
Tag	[31:24]	Fixed value: 0xEB (Enter Boot)
boot mode	[23:20]	0 - Determined by BMODE in SMBR2 or other Fuse combinations 1 - Serial downloader
Serial downloader media	[19:16]	0 - Auto detection 1 - USB 2 - UART
Reserved	[15:04]	
Boot image selection	[03: 00]	0 - Image 0 (Primary image) 1 - Image 1 (Redundant image, with primary image bypassed) 2 - Image 2 3 - Image 3 <b>NOTE:</b> It takes effect only if the boot mode is 0.

#### *Typical use cases*

1. Enter Serial downloader mode and select USB as the communication peripheral.

```
uint32_t arg = 0xeb100000;
runBootloader (&arg);
```

2. Select Image1 (Redundant image) as the boot image after reliable update in user application.

```
uint32_t arg = 0xeb000001;
runBootloader (&arg);
```

### 9.13.4 Watchdog API

The Watchdog API definition is identical to the SDK driver, see the SDK driver for more details.

# Chapter 10

## External Signals and Pin Multiplexing

### 10.1 Overview

The chip contains a limited number of pins, most of which have multiple signal options. These signal-to-pin and pin-to-signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

The muxing options table lists the external signals grouped by the module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

#### 10.1.1 Muxing Options

##### NOTE

System STOP/WAIT status can be observed on pin. See [CCM\\_WAIT](#) and [CCM\\_STOP](#) in the table below.

**Table 10-1. Muxing Options**

Instance	Port	Pad	Mode
ADC1	ADC1_IN0	GPIO_AD_B1_11 <a href="#">pin 21</a>	-

# Chapter 11

## IOMUX Controller (IOMUXC)

### 11.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 11-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

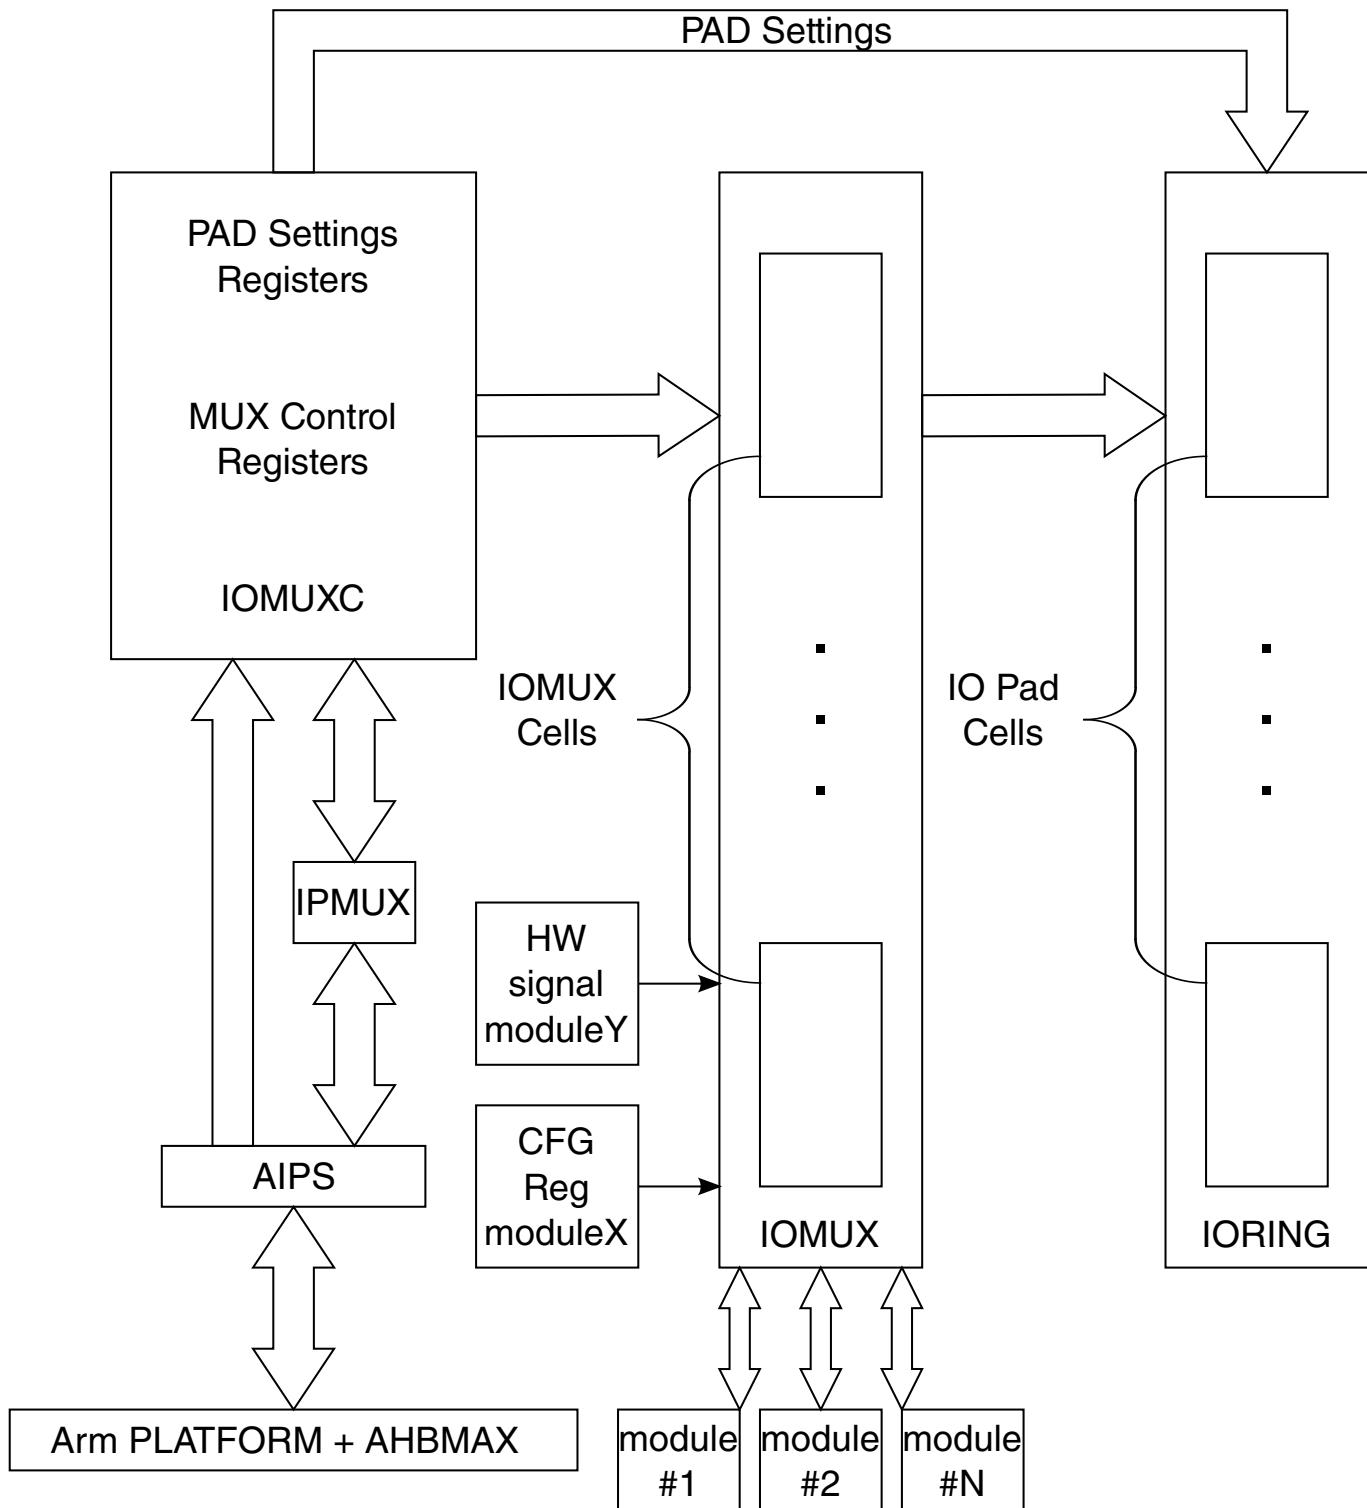

Figure 11-1. IOMUX SoC Level Block Diagram

## 11.1.1 Block Diagram

The high level illustration of the IO cells is shown in [Figure 11-3](#)

## 11.1.2 Features

The IOMUXC features include:

- 32-bit software mux control registers (IOMUXC\_SW\_MUX\_CTL\_PAD\_<PAD NAME> or IOMUXC\_SW\_MUX\_CTL\_GRP\_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX\_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC\_SW\_PAD\_CTL\_PAD\_<PAD\_NAME> or IOMUXC\_SW\_PAD\_CTL\_GRP\_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - several (GPR0 to GPRn) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX\_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

## 11.2 Functional description

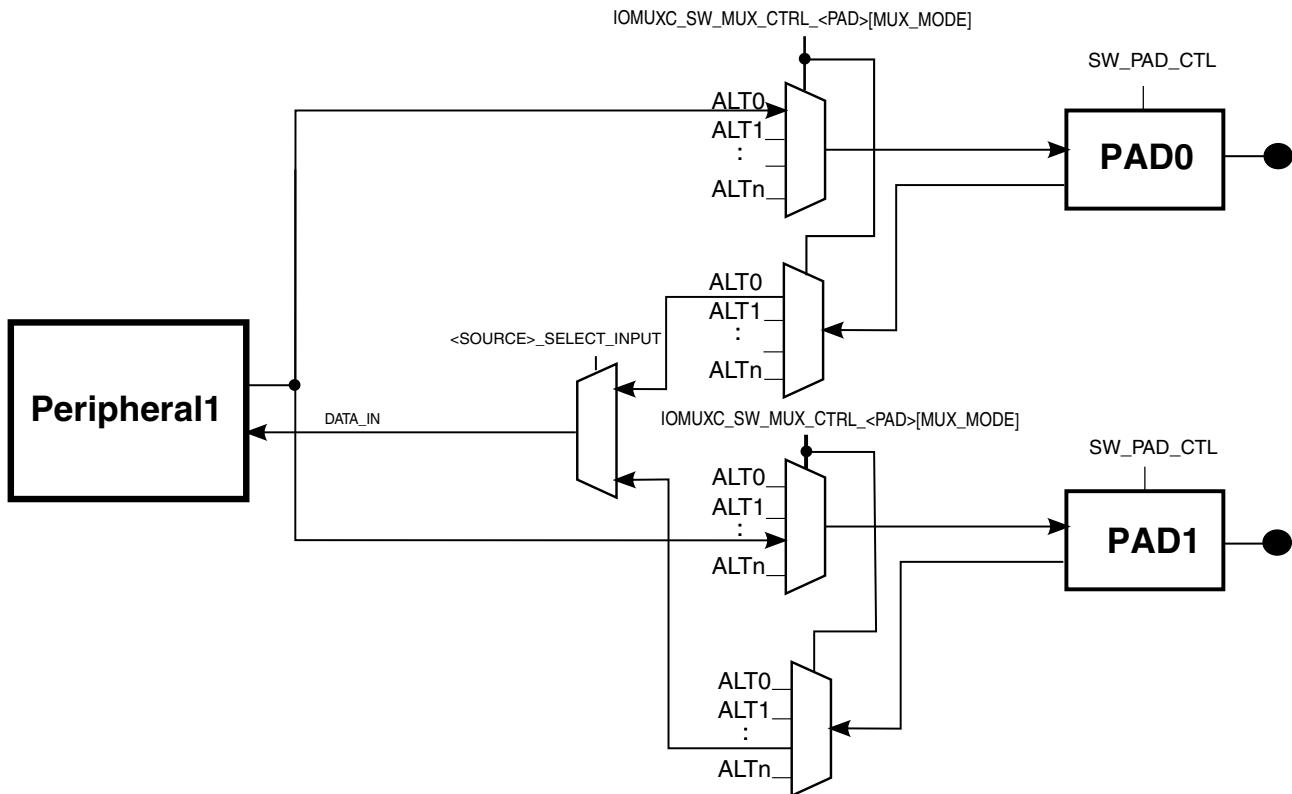

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC\_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC\_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux\_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux\_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 11-2](#).

**Figure 11-2. IOMUX Cell Block Diagram**

### 11.2.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

11.2.1 refers to an internal capability of the IOMUX hardware. You can't really make use of the "ALT6 and ALT7 extended muxing modes" from software.

## 11.2.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ib[1]` == 1'b1) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the `IOMUXC_SW_MUX_CTL` register (when available) to "1".

Uses include:

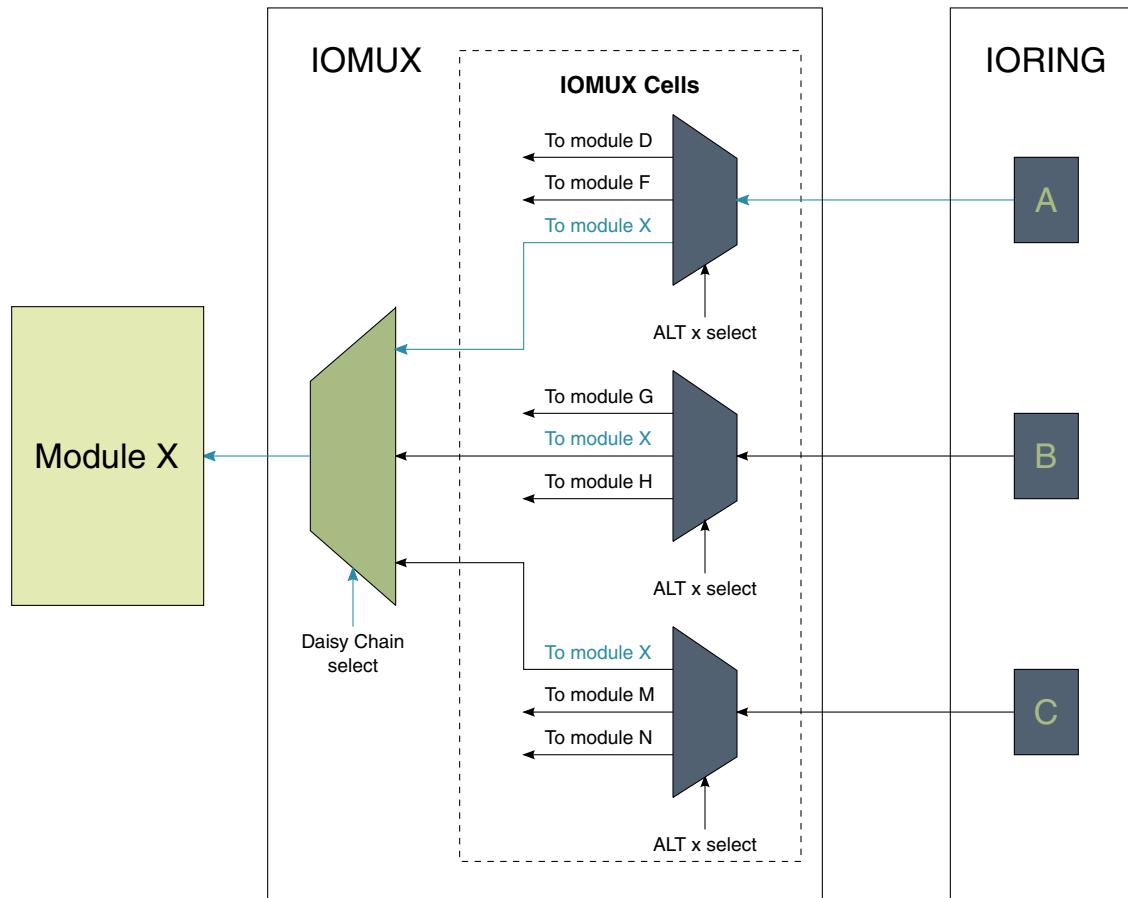

- LoopBack - Module x drives the pad and also receives pad value as an input.

### 11.2.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

**Figure 11-3. Daisy chain illustration**

## 11.2.4 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 11-1. IOMUXC Clocks**

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 11.3 IOMUXC GPR Memory Map/Register Definition

### IOMUXC\_GPR\_GPR1 field descriptions

Field	Description
31 CM7_FORCE_HCLK_EN	Arm CM7 platform AHB clock enable  This bitfield determines whether or not the AHB clock is running when CM7 is sleeping. If the AHB clock is not enabled with this bit, the TCM is not accessible.  0 AHB clock is not running (gated) when CM7 is sleeping and TCM is not accessible. 1 AHB clock is running (enabled) when CM7 is sleeping and TCM is accessible.
30–24 -	This field is reserved. Reserved
23 ENET_IPG_CLK_S_EN	ENET and ENET2 ipg_clk_s clock gating enable  0 ipg_clk_s is gated when there is no IPS access 1 ipg_clk_s is always on
22 EXC_MON	Exclusive monitor response select of illegal command  This bit sets the bus response value when CM7 exclusive access fails.

Field	Description
31–25 LOCK_OCRAM_TZ_ADDR	Lock OCRAM_TZ_ADDR field for changes. This is a sticky field, once set it cannot be cleared (only by reset).  0 Field is not locked 1 Field is locked (read access only)
24 LOCK_OCRAM_TZ_EN	Lock OCRAM_TZ_EN field for changes. This is a sticky field, once set it cannot be cleared (only by reset).  0 Field is not locked 1 Field is locked (read access only)
23–21 -	This field is reserved. Reserved
20 LOCK_DCPKEY_OCOTP_OR_KEYMUX	Lock DCP Key OCOTP/Key MUX selection bit. This is a sticky field, once set it cannot be cleared (only by reset).  0 Field is not locked 1 Field is locked (read access only)

Table continues on the next page...

**IOMUXC\_GPR\_GPR10 field descriptions (continued)**

Field	Description
19 -	This field is reserved. Reserved
18 LOCK_SEC_ERR_RESP	Lock SEC_ERR_RESP field for changes. This is a sticky field, once set it cannot be cleared (only by reset).  0 Field is not locked 1 Field is locked (read access only)
17 LOCK_DBG_EN	Lock DBG_EN field for changes. This is a sticky field, once set it cannot be cleared (only by reset).  0 Field is not locked 1 Field is locked (read access only)
16 LOCK_NIDEN	Lock NIDEN field for changes. This is a sticky field, once set it cannot be cleared (only by reset).  0 Field is not locked 1 Field is locked (read access only)
15–9 OCRAM_TZ_ADDR	OCRAM TrustZone (TZ) start address. This is the start address of the secure memory region within the OCRAM memory space is 4 KB granularity. The start address affects the OCRAM transactions only if OCRAM_TZ_EN bit is set. The OCRAM TZ ENDADDR is not configurable and is set to the end of OCRAM memory space.
8 OCRAM_TZ_EN	OCRAM TrustZone (TZ) enable.  0 The TrustZone feature is disabled. Entire OCRAM space is available for all access types (secure/non-secure/user/supervisor). 1 The TrustZone feature is enabled. Access to address in the range specified by [ENDADDR:STARTADDR] follows the execution mode access policy described in CSU chapter.
7–5 -	This field is reserved. Reserved
4 DCPKEY_OCOTP_OR_KEYMUX	DCP Key selection bit.  0 Select key from SNVS Master Key. 1 Select key from OCOTP (SW_GP2).
3 -	This field is reserved. Reserved
2 SEC_ERR_RESP	Security error response enable for all security gaskets (on both AHB and AXI buses)  0 OKEY response 1 SLVError (default)
1 DBG_EN	Arm invasive debug enable  0 Debug turned off. 1 Debug enabled (default).
0 NIDEN	Arm non-secure (non-invasive) debug enable  0 Debug turned off. 1 Debug enabled (default).

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

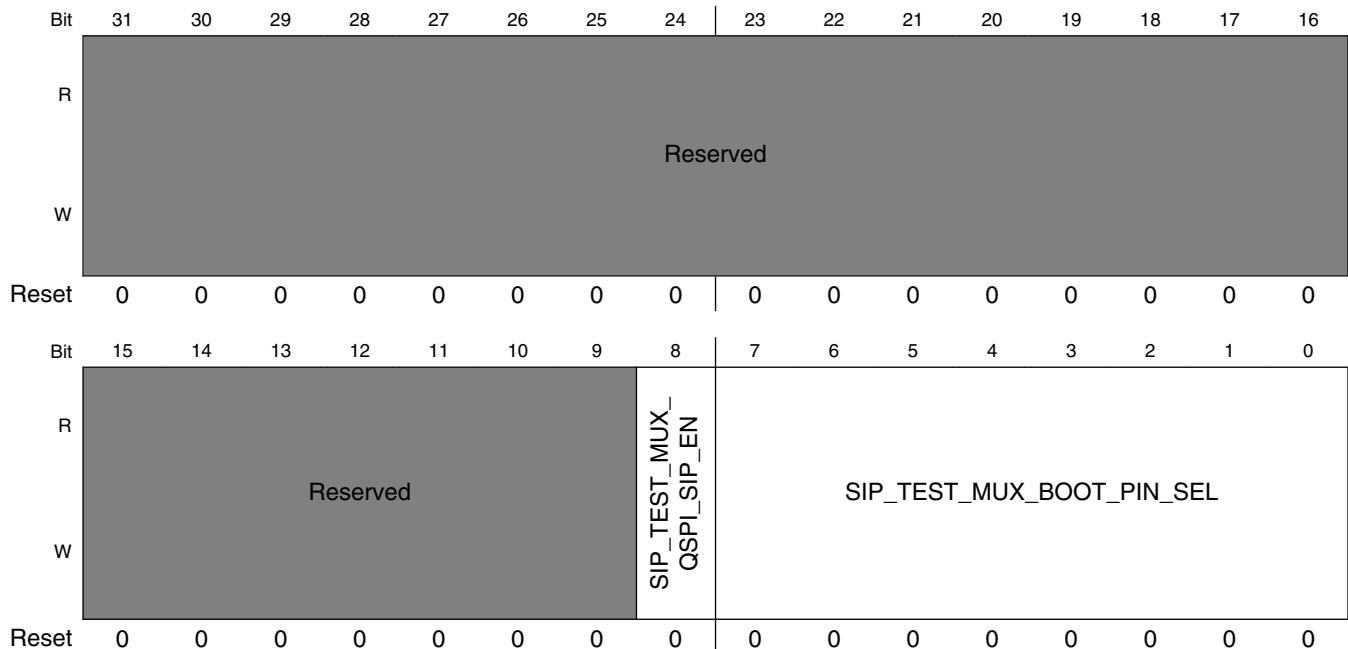

**IOMUXC\_GPR\_GPR33 field descriptions**

Field	Description
31–24 -	This field is reserved. Reserved
23–17 LOCK_ OCRAM2_TZ_ ADDR	Lock OCRAM2_TZ_ADDR field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
16 LOCK_ OCRAM2_TZ_ EN	Lock OCRAM2_TZ_EN field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
15–8 -	This field is reserved. Reserved
7–1 OCRAM2_TZ_ ADDR	OCRAM2 TrustZone (TZ) start address. This is the start address of the secure memory region within the OCRAM2 memory space is 4 KB granularity. The start address affects the OCRAM2 transactions only if OCRAM2_TZ_EN bit is set. The OCRAme TZ ENDADDR is not configurable and is set to the end of OCRAM2 memory space.
0 OCRAM2_TZ_ EN	OCRAM2 TrustZone (TZ) enable. 0 The TrustZone feature is disabled. Entire OCRAM2 space is available for all access types (secure/non-secure/user/supervisor). 1 The TrustZone feature is enabled. Access to address in the range specified by [ENDADDR:STARTADDR] follows the execution mode access policy described in CSU chapter.

### 11.3.35 GPR34 General Purpose Register (IOMUXC\_GPR\_GPR34)

#### GPR Register

Address: 400A\_C000h base + 88h offset = 400A\_C088h

#### IOMUXC\_GPR\_GPR34 field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
8 SIP_TEST_MUX_QSPI_SIP_EN	Enable SIP_TEST_MUX 0 SIP_TEST_MUX is disabled 1 SIP_TEST_MUX is enabled
SIP_TEST_MUX_BOOT_PIN_SEL	Boot Pin select in SIP_TEST_MUX This field is active only when SIP_TEST_MUX_QSPI_SIP_EN is 1.

## 11.4 IOMUXC SNVS Memory Map/Register Definition

16 HYS	<p>Hyst. Enable Field</p> <p>Select one out of next values for pad: PMIC_STBY_REQ</p> <p>The hysteresis (HYS) bit controls whether a pin acts as a Schmitt trigger, which is a comparator remembering its last input state (hysteresis).</p> <p>0 <b>HYS_0_Hysteresis_Disabled</b> — Hysteresis Disabled (CMOS input) 1 <b>HYS_1_Hysteresis_Enabled</b> — Hysteresis Enabled (Schmitt Trigger input)</p>
15–14 PUS	<p>Pull Up / Down Config. Field</p> <p>Controls signals to select pull-up or pull-down internal resistance strength.</p>

*Table continues on the next page...*

**IOMUXC\_SNVS\_SW\_PAD\_CTL\_PAD\_PMIC\_STBY\_REQ field descriptions (continued)**

Field	Description
	Select one out of next values for pad: PMIC_STBY_REQ  00 <b>PUS_0_100K_Ohm_Pull_Down</b> — 100K Ohm Pull Down 01 <b>PUS_1_47K_Ohm_Pull_Up</b> — 47K Ohm Pull Up 10 <b>PUS_2_100K_Ohm_Pull_Up</b> — 100K Ohm Pull Up 11 <b>PUS_3_22K_Ohm_Pull_Up</b> — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field  Control signal to enable internal pull-up/down resistors or pad keeper functionality.  Select one out of next values for pad: PMIC_STBY_REQ  0 <b>PUE_0_Keeper</b> — Keep the previous output value when the output driver is disabled. 1 <b>PUE_1_Pull</b> — Pull-up or pull-down (determined by PUS field).
12 PKE	Pull / Keep Enable Field  Select one out of next values for pad: PMIC_STBY_REQ  The pull/keeper function for a given pin is controlled by the PKE, PUE and PUS bits. The pull/keeper can be enabled by the pull/keep enable (PKE) bit. When the pull/keeper is enabled, the PUE (pull-up enable) bit selects either a pull-up/pull-down resistor on the output or a keeper device (keep the previous output value).  When the pull/keeper is disabled, PUE and PUS have no functionality.  0 <b>PKE_0_Pull_Keeper_Disabled</b> — Pull/Keeper Disabled 1 <b>PKE_1_Pull_Keeper_Enabled</b> — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field  Select one out of next values for pad: PMIC_STBY_REQ  If set to 1, the output driver drives only logic 0. The drain of the internal transistor is open. It means that logic 1 has to be driven by an external component. This option is essential if connection between the pad and an external component is bi-directional. If ODE = 0, then the output driver drives logic 1 and logic 0.  0 <b>ODE_0_Open_Drain_Disabled</b> — Open Drain Disabled (Output is CMOS) 1 <b>ODE_1_Open_Drain_Enabled</b> — Open Drain Enabled (Output is Open Drain)
10–8 -	This field is reserved. Reserved
7–6 SPEED	Speed Field  SPEED is a selectable bit field that sets electrical characteristics of a pin in a given frequency range. This field provides additional 2-bit slew rate control. These options can either increase the output driver current in the higher frequency range, or reduce the switching noise in the lower frequency range.  The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.  10 <b>Medium</b> — 100MHz
5–3 DSE	Drive Strength Field  Select one out of next values for pad: PMIC_STBY_REQ  The drive strength enable (DSE) can be explained as series resistance between an ideal driver's output and its load. To achieve maximal transferred power, the impedance of the driver has to match the load impedance.

*Table continues on the next page...*

**IOMUXC\_SNVS\_SW\_PAD\_CTL\_PAD\_PMIC\_STBY\_REQ field descriptions (continued)**

Field	Description
	<p>Note: Typical values provided, please see GPIO spec for full impedance range.</p> <p>000 <b>DSE_0</b> — HI-Z      001 <b>DSE_1</b> — Dual/Single voltage: 262/260 Ohm @ 1.8V, 247/157 Ohm @ 3.3V      010 <b>DSE_2</b> — Dual/Single voltage: 134/130 Ohm @ 1.8V, 126/78 Ohm @ 3.3V      011 <b>DSE_3</b> — Dual/Single voltage: 88/88 Ohm @ 1.8V, 84/53 Ohm @ 3.3V      100 <b>DSE_4</b> — Dual/Single voltage: 62/65 Ohm @ 1.8V, 57/39 Ohm @ 3.3V      101 <b>DSE_5</b> — Dual/Single voltage: 51/52 Ohm @ 1.8V, 47/32 Ohm @ 3.3V      110 <b>DSE_6</b> — Dual/Single voltage: 43/43 Ohm @ 1.8V, 40/26 Ohm @ 3.3V      111 <b>DSE_7</b> — Dual/Single voltage: 37/37 Ohm @ 1.8V, 34/23 Ohm @ 3.3V</p>
2–1 -	This field is reserved. Reserved
0 SRE	<p>Slew Rate Field</p> <p>Select one out of next values for pad: PMIC_STBY_REQ</p> <p>This bitfield controls how fast the pin toggles between the two logic states. Since rapidly changing states consume more power and generate spikes, it should be enabled only when necessary.</p> <p>The operational frequency on GPIO pads is dependent on slew rate (SRE), speed (SPEED), and supply voltage (OVDD). See Operating Frequency table in the GPIO block guide for more details.</p> <p>0 <b>SRE_0_Slow_Slew_Rate</b> — Slow Slew Rate      1 <b>SRE_1_Fast_Slew_Rate</b> — Fast Slew Rate</p>

## 11.6.1 SW\_MUX\_CTL\_PAD\_GPIO EMC\_00 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_00)

### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 14h offset = 401F\_8014h

### IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_00 field descriptions

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_00 0 <b>DISABLED</b> — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_00.  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA00 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM4_PWMA00 of instance: flexpwm4 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: LPSPI2_SCK of instance: lpspi2

Table continues on the next page...

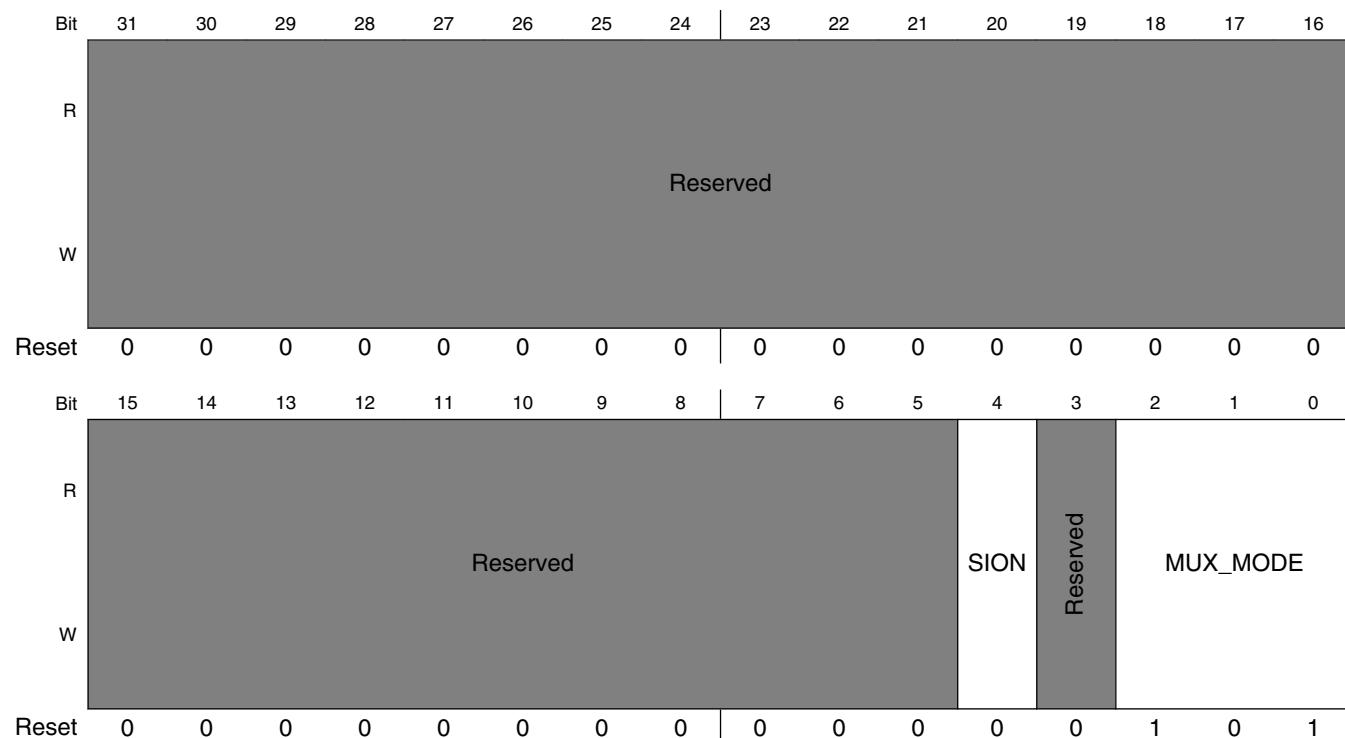

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_00 field descriptions (continued)**

Field	Description
	011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_XBAR_IN02 of instance: xbar1
	100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO00 of instance: flexio1
	101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO00 of instance: gpio4

## 11.6.2 SW\_MUX\_CTL\_PAD\_GPIO EMC\_01 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_01)

### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 18h offset = 401F\_8018h

### IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_01 field descriptions

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_01 0 <b>DISABLED</b> — Input Path is determined by functionality

Table continues on the next page...

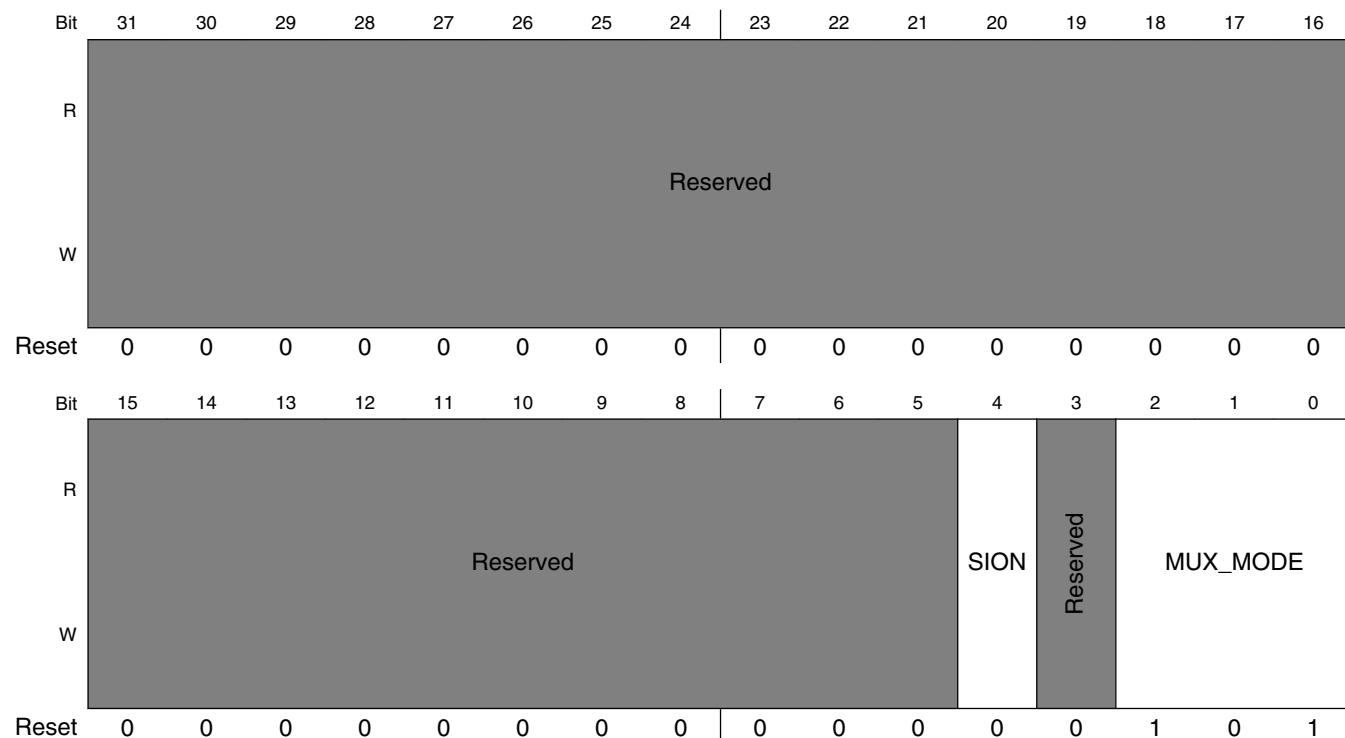

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_01 field descriptions (continued)**

Field	Description
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_01.  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA01 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM4_PWMB00 of instance: flexpwm4 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: LPSPI2_PCS0 of instance: lpspi2 011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_IN03 of instance: xbar1 100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO01 of instance: flexio1 101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO01 of instance: gpio4

### 11.6.3 SW\_MUX\_CTL\_PAD\_GPIO EMC\_02 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_02)

#### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 1Ch offset = 401F\_801Ch

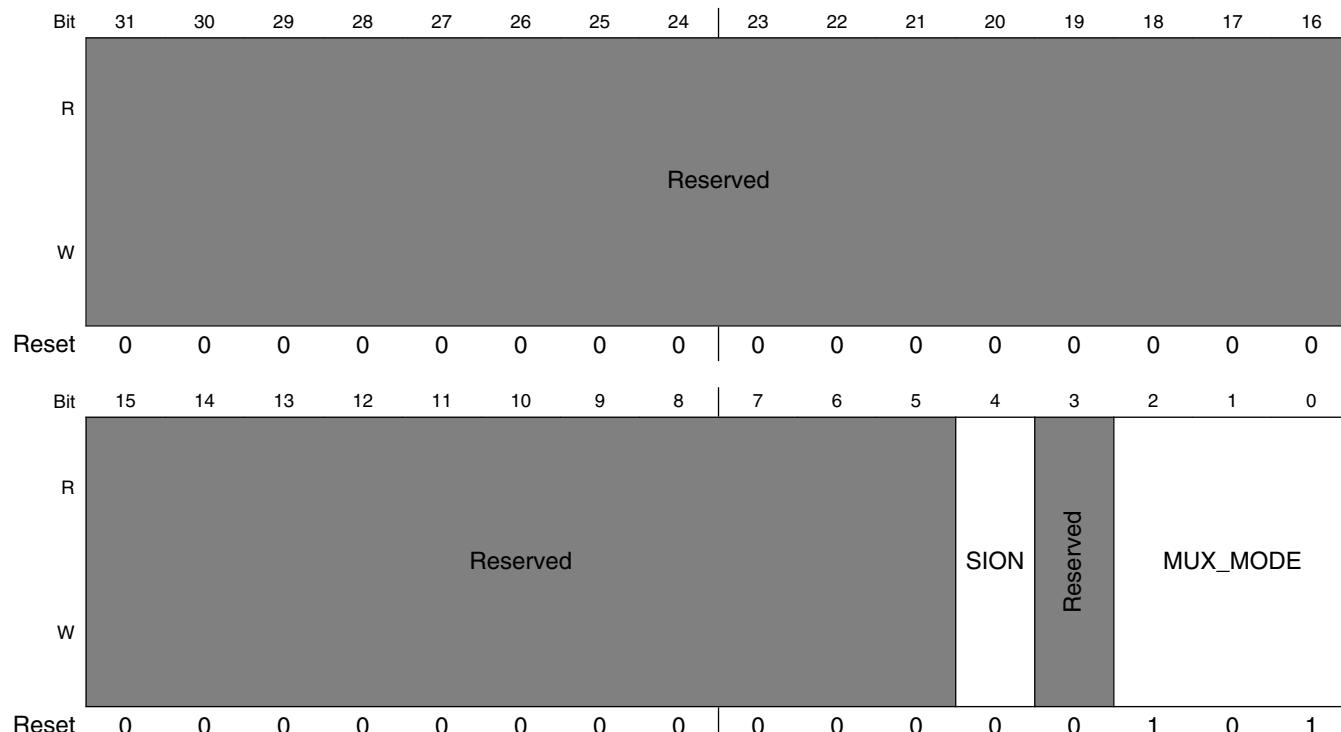

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_02 field descriptions**

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_02 0 <b>DISABLED</b> — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_02.  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA02 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM4_PWMA01 of instance: flexpwm4 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: LPSPI2_SDO of instance: lpspi2 011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT04 of instance: xbar1 100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO02 of instance: flexio1 101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO02 of instance: gpio4

## 11.6.4 SW\_MUX\_CTL\_PAD\_GPIO EMC\_03 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_03)

### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 20h offset = 401F\_8020h

### IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_03 field descriptions

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_03 0 <b>DISABLED</b> — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_03.  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA03 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM4_PWMB01 of instance: flexpwm4 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: LPSPI2_SDI of instance: lpspi2

Table continues on the next page...

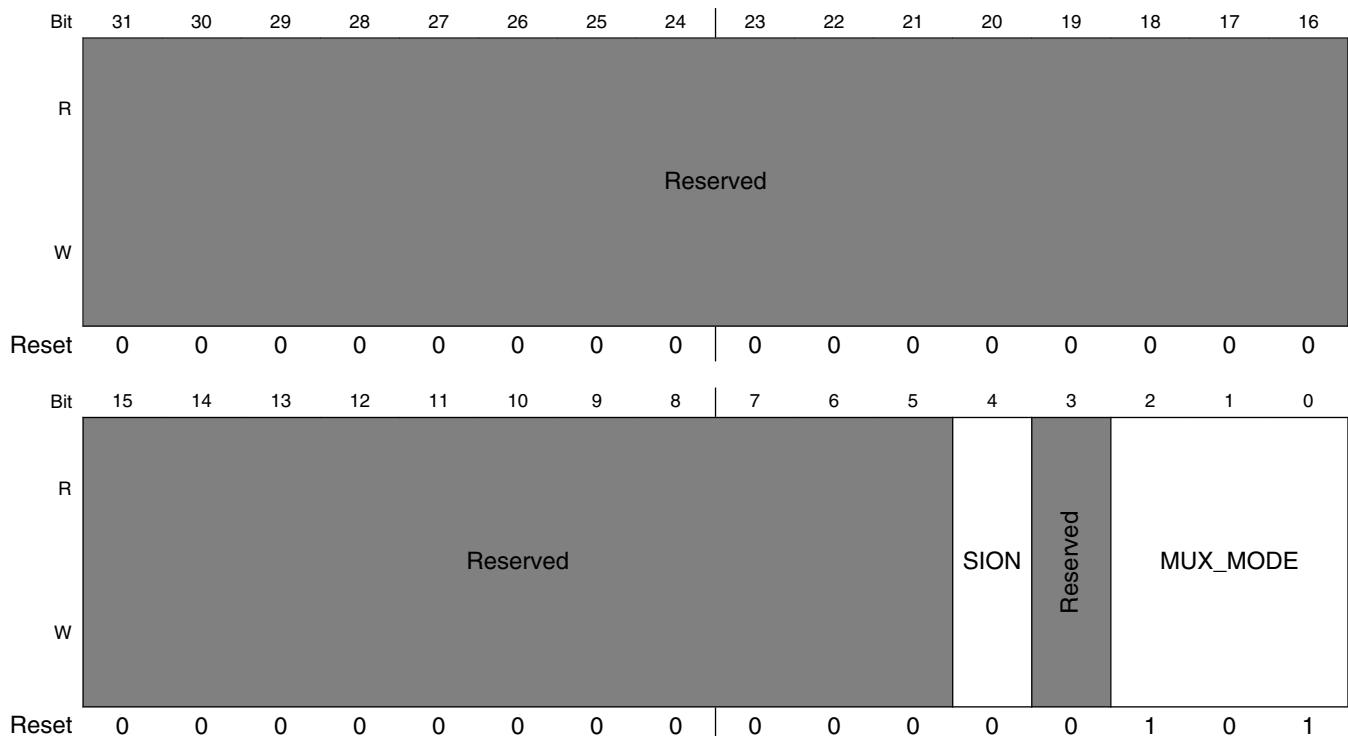

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_03 field descriptions (continued)**

Field	Description
	011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT05 of instance: xbar1
	100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO03 of instance: flexio1
	101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO03 of instance: gpio4

## 11.6.5 SW\_MUX\_CTL\_PAD\_GPIO EMC\_04 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_04) pin 2

**SW\_MUX\_CTL Register**

Address: 401F\_8000h base + 24h offset = 401F\_8024h

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_04 field descriptions**

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_04 0 <b>DISABLED</b> — Input Path is determined by functionality

*Table continues on the next page...*

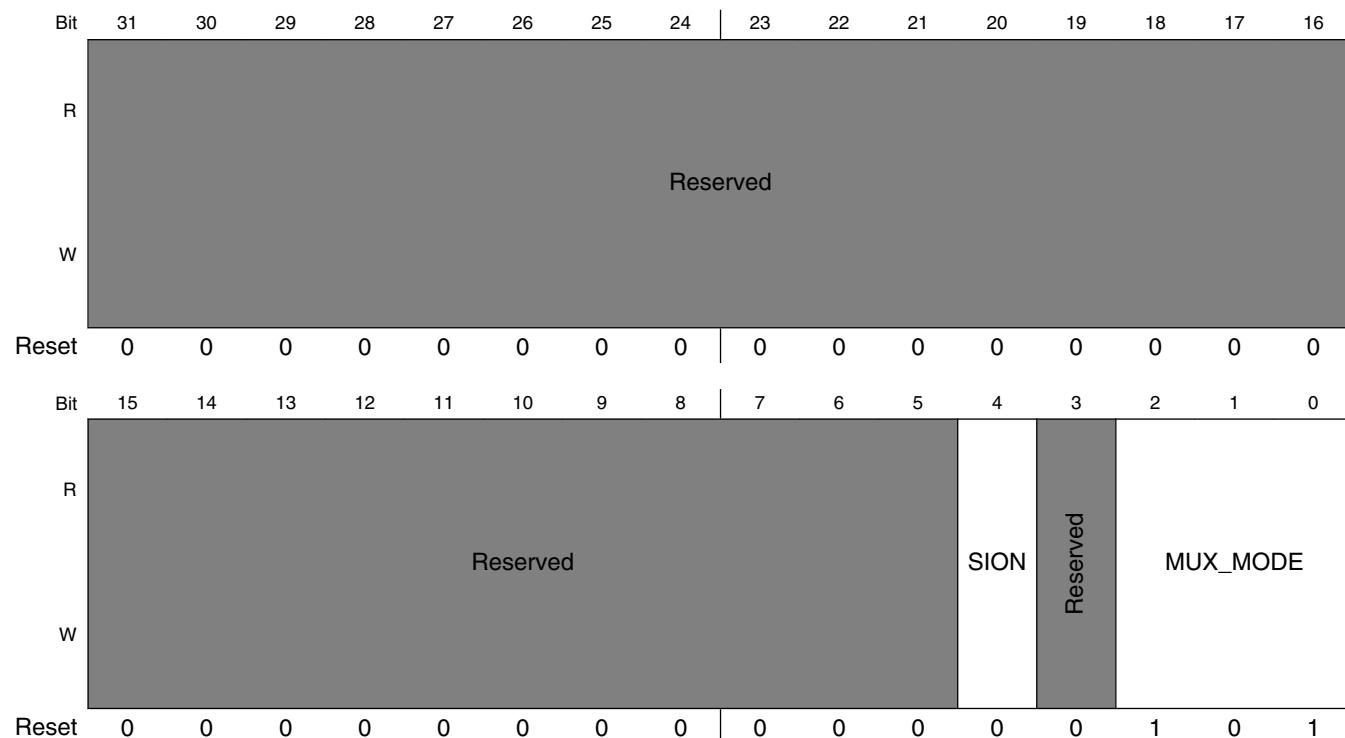

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO\_EMC\_04 field descriptions (continued)**

Field	Description
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO_EMC_04. <b>pin 2</b>  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA04 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM4_PWMA02 of instance: flexpwm4 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: SAI2_TX_DATA of instance: sai2 011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT06 of instance: xbar1 100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO04 of instance: flexio1 101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO04 of instance: gpio4

## 11.6.6 SW\_MUX\_CTL\_PAD\_GPIO\_EMC\_05 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO\_EMC\_05) pin 3

**SW\_MUX\_CTL Register**

Address: 401F\_8000h base + 28h offset = 401F\_8028h

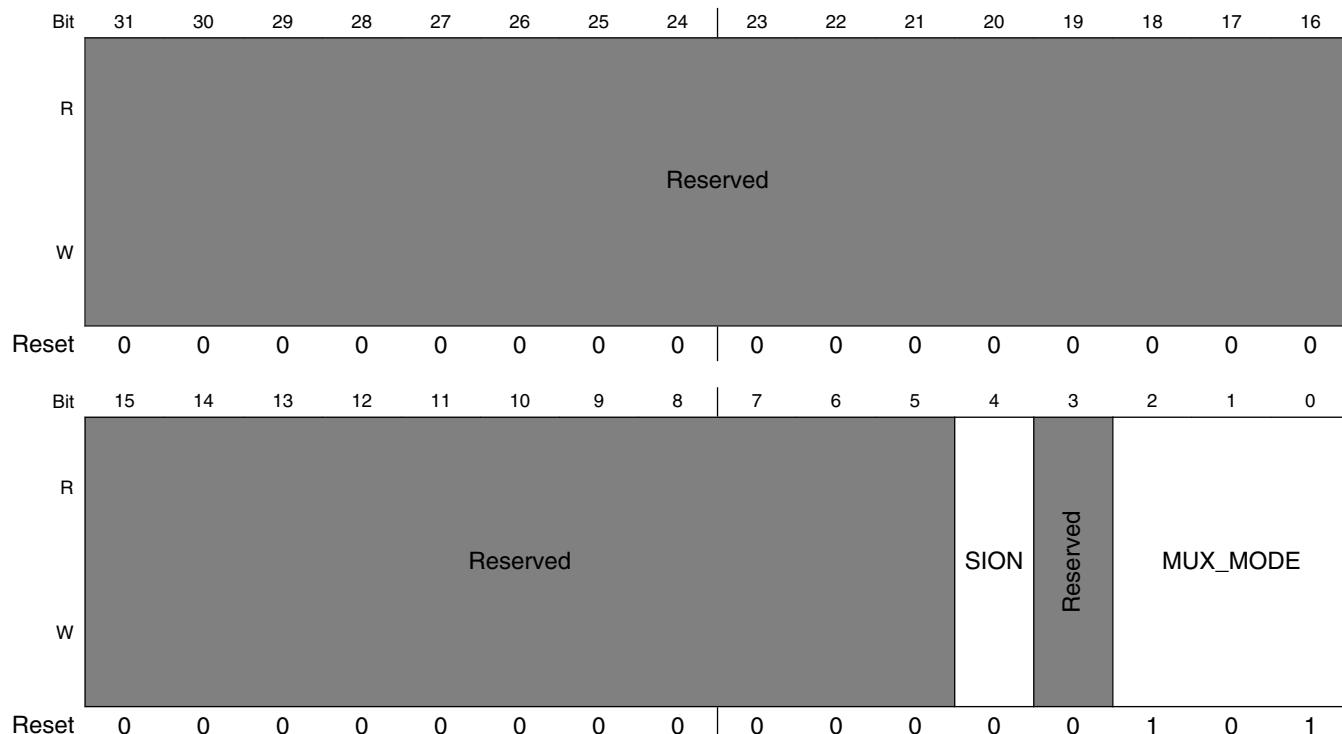

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_05 field descriptions pin 3**

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_05 0 <b>DISABLED</b> — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_05. <span style="color:red">pin 3</span>  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA05 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM4_PWMB02 of instance: flexpwm4 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: SAI2_TX_SYNC of instance: sai2 011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT07 of instance: xbar1 100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO05 of instance: flexio1 101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO05 of instance: gpio4

## 11.6.7 SW\_MUX\_CTL\_PAD\_GPIO EMC\_06 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_06) pin 4

### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 2Ch offset = 401F\_802Ch

### IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_06 field descriptions pin 4

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_06 0 <b>DISABLED</b> — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_06. <span style="color:red">pin 4</span>  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA06 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM2_PWMA00 of instance: flexpwm2 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: SAI2_TX_BCLK of instance: sai2

Table continues on the next page...

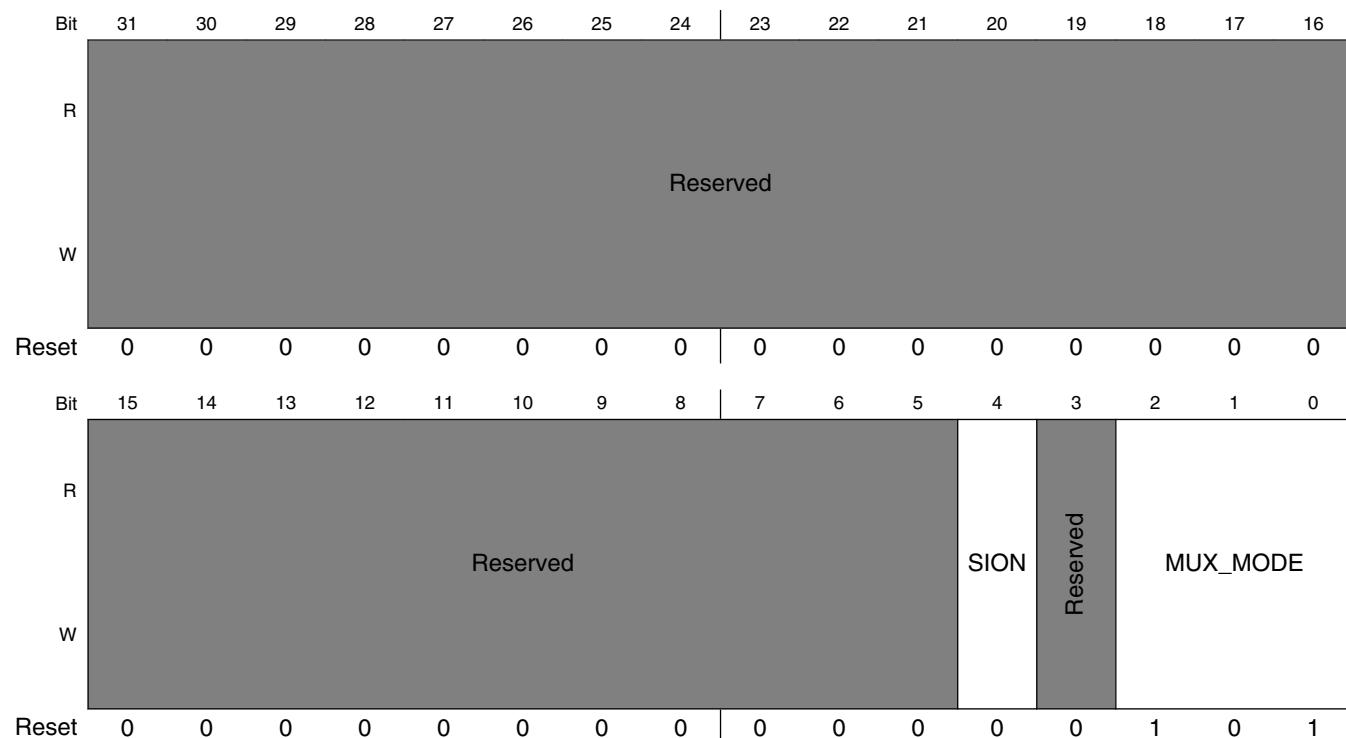

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_06 field descriptions (continued) pin 4**

Field	Description
	011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT08 of instance: xbar1
	100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO06 of instance: flexio1
	101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO06 of instance: gpio4

## 11.6.8 SW\_MUX\_CTL\_PAD\_GPIO EMC\_07 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_07) pin 33

### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 30h offset = 401F\_8030h

### IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_07 field descriptions

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_07 0 <b>DISABLED</b> — Input Path is determined by functionality

Table continues on the next page...

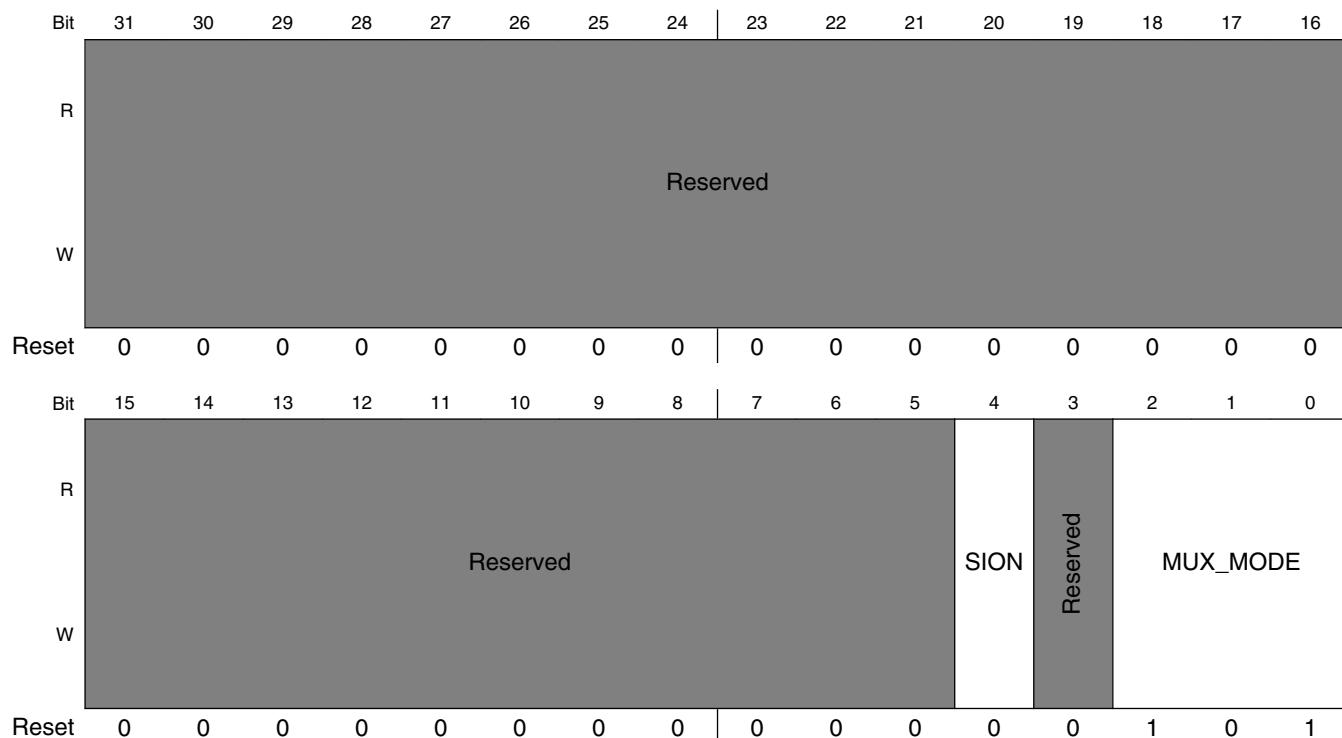

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_07 field descriptions (continued)**

Field	Description
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_07. <b>pin 33</b>  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DATA07 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM2_PWMB00 of instance: flexpwm2 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: SAI2_MCLK of instance: sai2 011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT09 of instance: xbar1 100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO07 of instance: flexio1 101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO07 of instance: gpio4

## 11.6.9 SW\_MUX\_CTL\_PAD\_GPIO EMC\_08 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_08) pin 5

**SW\_MUX\_CTL Register**

Address: 401F\_8000h base + 34h offset = 401F\_8034h

**IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_08 field descriptions pin 5**

Field	Description
31–5 -	This field is reserved. Reserved
4 SION	Software Input On Field.  Force the selected mux mode Input path no matter of MUX_MODE functionality.  1 <b>ENABLED</b> — Force input path of pad GPIO EMC_08 0 <b>DISABLED</b> — Input Path is determined by functionality
3 -	This field is reserved. Reserved
MUX_MODE	MUX Mode Select Field.  Select one of iomux modes to be used for pad: GPIO EMC_08.  000 <b>ALT0</b> — Select mux mode: ALT0 mux port: SEMC_DM00 of instance: semc 001 <b>ALT1</b> — Select mux mode: ALT1 mux port: FLEXPWM2_PWMA01 of instance: flexpwm2 010 <b>ALT2</b> — Select mux mode: ALT2 mux port: SAI2_RX_DATA of instance: sai2 011 <b>ALT3</b> — Select mux mode: ALT3 mux port: XBAR1_INOUT17 of instance: xbar1 100 <b>ALT4</b> — Select mux mode: ALT4 mux port: FLEXIO1_FLEXIO08 of instance: flexio1 101 <b>ALT5</b> — Select mux mode: ALT5 mux port: GPIO4_IO08 of instance: gpio4

### 11.6.10 SW\_MUX\_CTL\_PAD\_GPIO EMC\_09 SW MUX Control Register (IOMUXC\_SW\_MUX\_CTL\_PAD\_GPIO EMC\_09)

#### SW\_MUX\_CTL Register

Address: 401F\_8000h base + 38h offset = 401F\_8038h

#### IOMUXC\_LPSPI1\_SDO\_SELECT\_INPUT field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi1, In Pin: lpspi_sdo  0 <b>GPIO_EMC_28_ALT3</b> — Selecting Pad: GPIO_EMC_28 for Mode: ALT3 1 <b>GPIO_SD_B0_02_ALT4</b> — Selecting Pad: GPIO_SD_B0_02 for Mode: ALT4

### 11.6.315 LPSPI2\_PCS0\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI2\_PCS0\_SELECT\_INPUT)

DAISY Register

Address: 401F\_8000h base + 4FCCh offset = 401F\_84FCCh

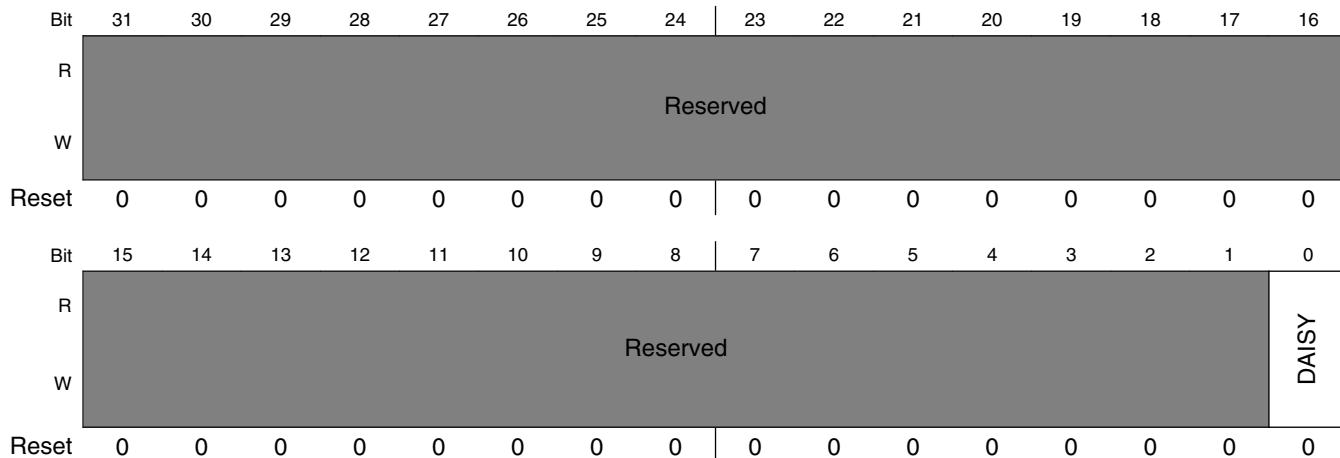

**IOMUXC\_LPSPI2\_PCS0\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: lpspi2, In Pin: lpspi_pcs0  0 <b>GPIO_SD_B1_06_ALT4</b> — Selecting Pad: GPIO_SD_B1_06 for Mode: ALT4 1 <b>GPIO_EMC_01_ALT2</b> — Selecting Pad: GPIO_EMC_01 for Mode: ALT2

### 11.6.316 LPSPI2\_SCK\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI2\_SCK\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 500h offset = 401F\_8500h

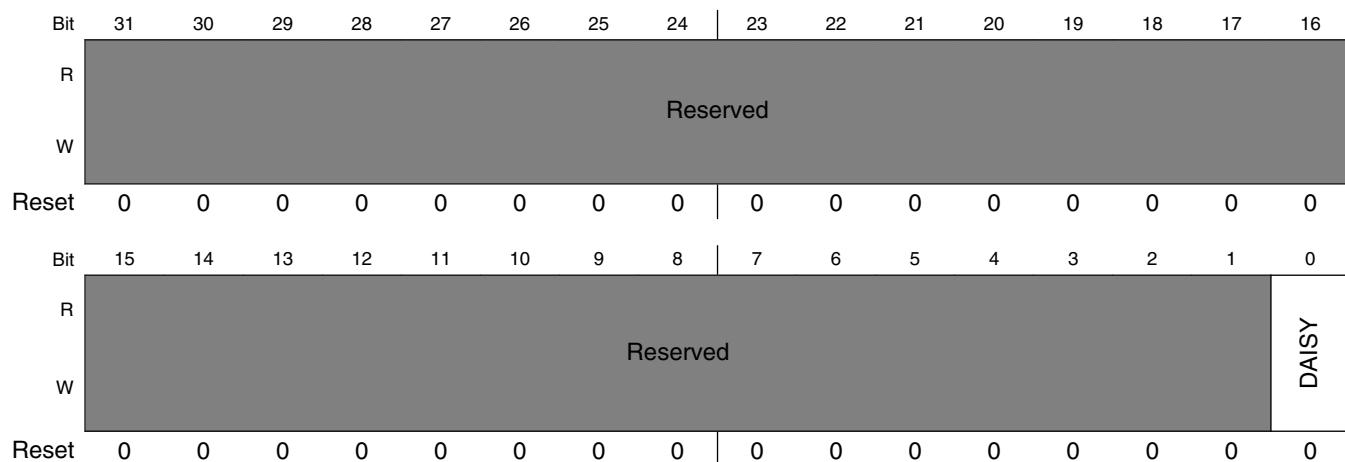

**IOMUXC\_LPSPI2\_SCK\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: lpspi2, In Pin: lpspi_sck  0 <b>GPIO_SD_B1_07_ALT4</b> — Selecting Pad: GPIO_SD_B1_07 for Mode: ALT4 1 <b>GPIO_EMC_00_ALT2</b> — Selecting Pad: GPIO_EMC_00 for Mode: ALT2

### 11.6.317 LPSPI2\_SD1\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI2\_SD1\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 504h offset = 401F\_8504h

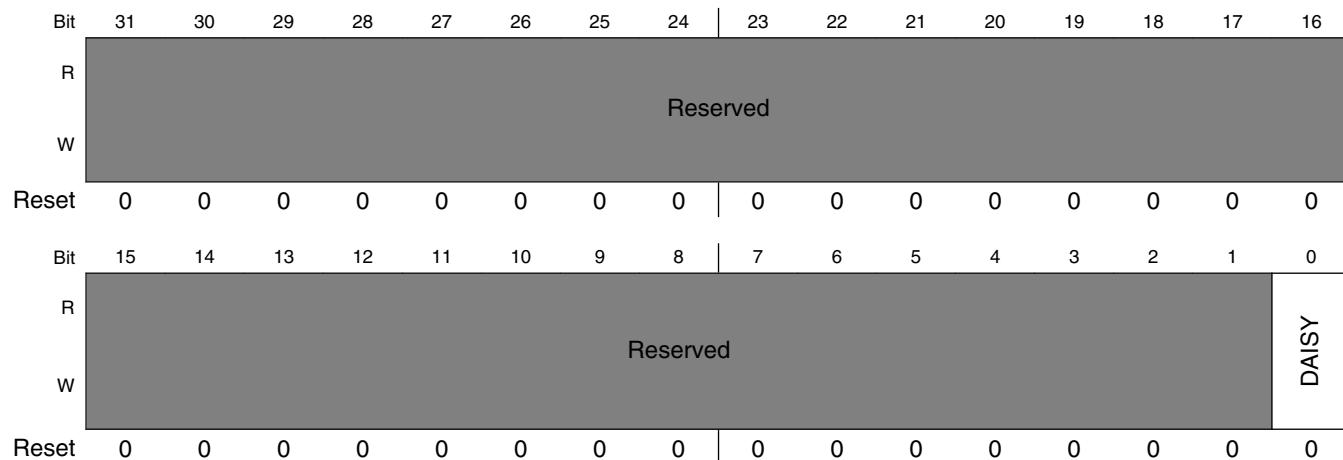

#### IOMUXC\_LPSPI2\_SD1\_SELECT\_INPUT field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: lpspi2, In Pin: lpspi_sdi  0 <b>GPIO_SD_B1_09_ALT4</b> — Selecting Pad: GPIO_SD_B1_09 for Mode: ALT4 1 <b>GPIO_EMC_03_ALT2</b> — Selecting Pad: GPIO_EMC_03 for Mode: ALT2

### 11.6.318 LPSPI2\_SDO\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI2\_SDO\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 508h offset = 401F\_8508h

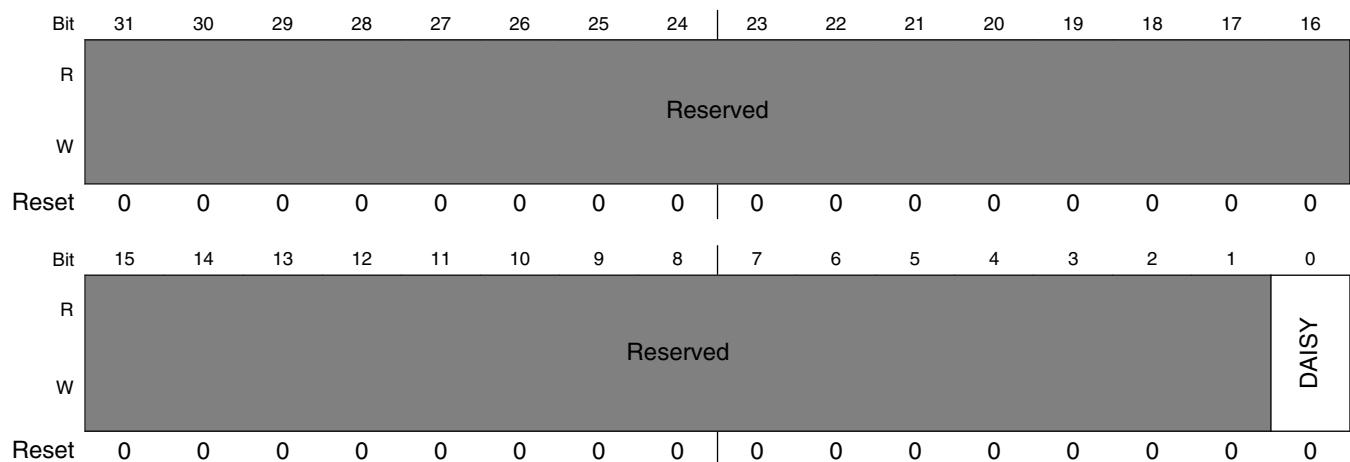

**IOMUXC\_LPSPI2\_SDO\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: lpspi2, In Pin: lpspi_sdo  0 <b>GPIO_SD_B1_08_ALT4</b> — Selecting Pad: GPIO_SD_B1_08 for Mode: ALT4 1 <b>GPIO_EMC_02_ALT2</b> — Selecting Pad: GPIO_EMC_02 for Mode: ALT2

### 11.6.319 LPSPI3\_PCS0\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI3\_PCS0\_SELECT\_INPUT)

DAISY Register

Address: 401F\_8000h base + 50Ch offset = 401F\_850Ch

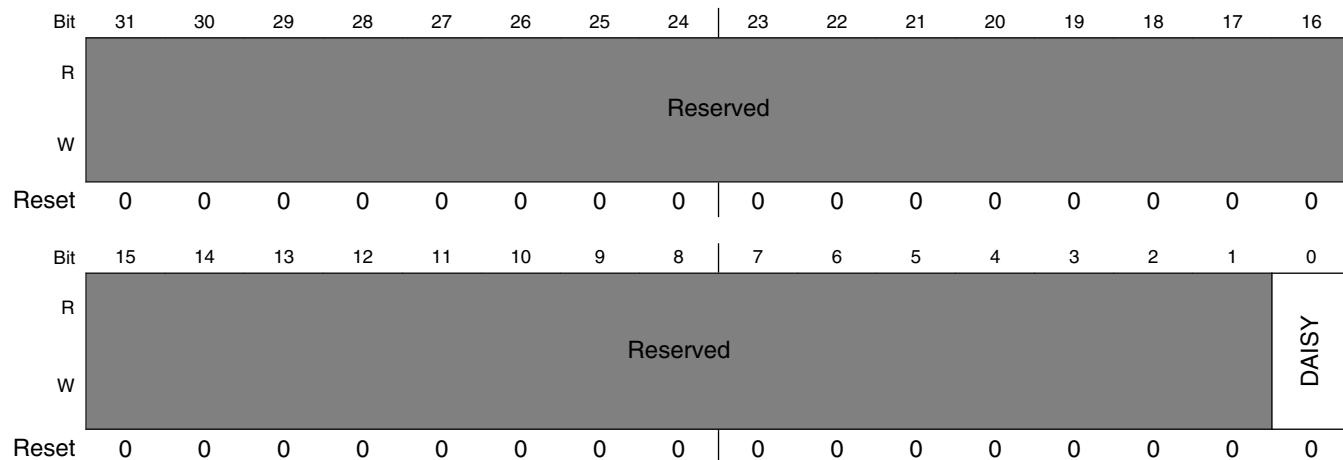

**IOMUXC\_LPSPI3\_PCS0\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi3, In Pin: lpspi_pcs0  0 <b>GPIO_AD_B0_03_ALT7</b> — Selecting Pad: GPIO_AD_B0_03 for Mode: ALT7 <b>pin 0</b> 1 <b>GPIO_AD_B1_12_ALT2</b> — Selecting Pad: GPIO_AD_B1_12 for Mode: ALT2 <b>pin 38 (T4.1)</b>

### 11.6.320 LPSPI3\_SCK\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI3\_SCK\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 510h offset = 401F\_8510h

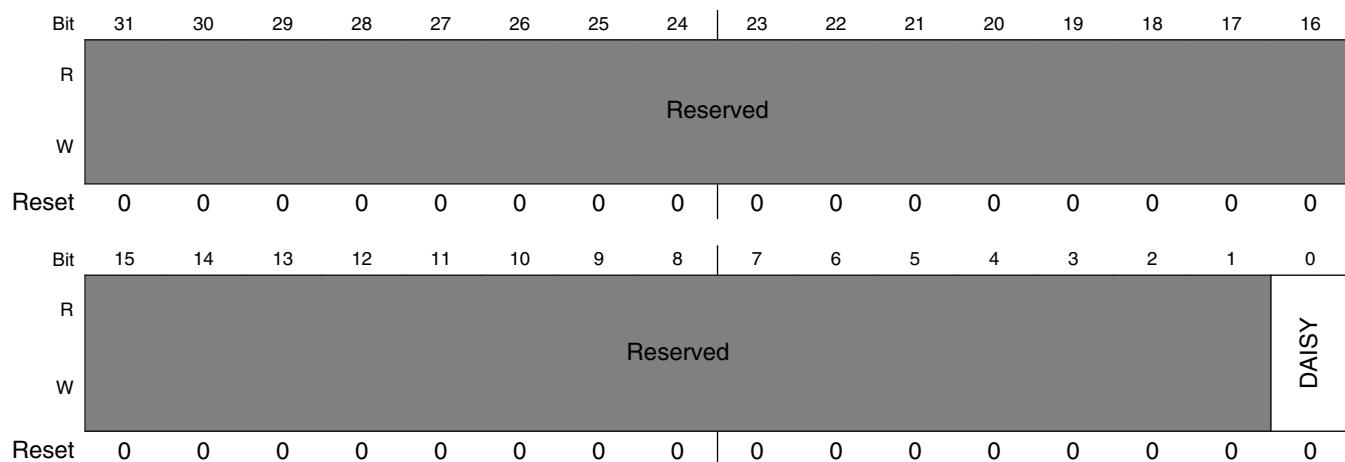

**IOMUXC\_LPSPI3\_SCK\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi3, In Pin: lpspi_sck  0 <b>GPIO_AD_B0_00_ALT7</b> — Selecting Pad: GPIO_AD_B0_00 for Mode: ALT7 1 <b>GPIO_AD_B1_15_ALT2</b> — Selecting Pad: GPIO_AD_B1_15 for Mode: ALT2 <b>pin 27</b>

### 11.6.321 LPSPI3\_SD1\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI3\_SD1\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 514h offset = 401F\_8514h

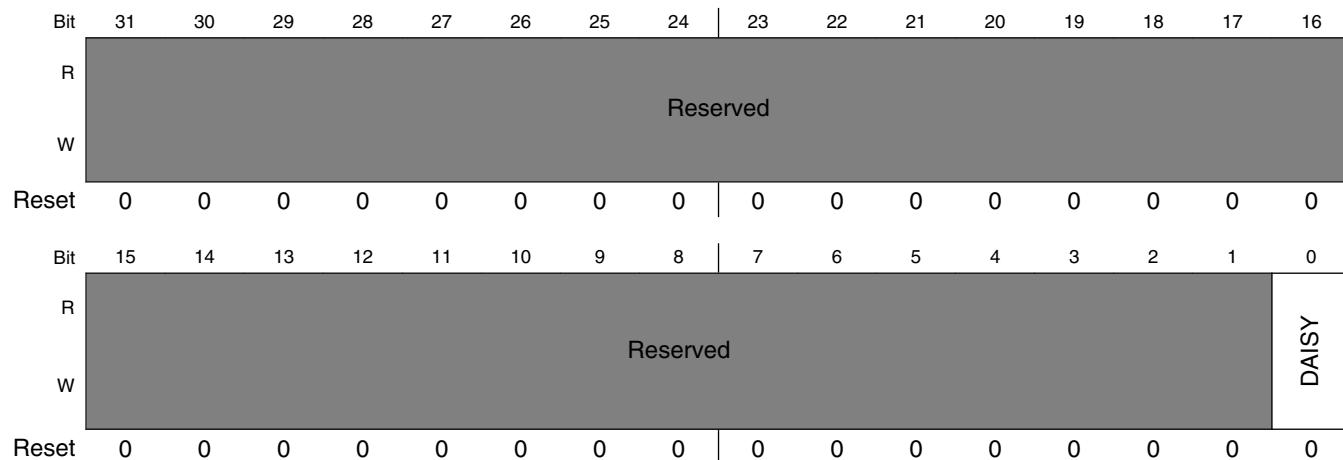

#### IOMUXC\_LPSPI3\_SD1\_SELECT\_INPUT field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi3, In Pin: lpspi_sdi  1 <b>GPIO_AD_B1_13_ALT2</b> — Selecting Pad: GPIO_AD_B1_13 for Mode: ALT2 <b>pin 39 (T4.1)</b> 0 <b>GPIO_AD_B0_02_ALT7</b> — Selecting Pad: GPIO_AD_B0_02 for Mode: ALT7 <b>pin 1</b>

### 11.6.322 LPSPI3\_SDO\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI3\_SDO\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 518h offset = 401F\_8518h

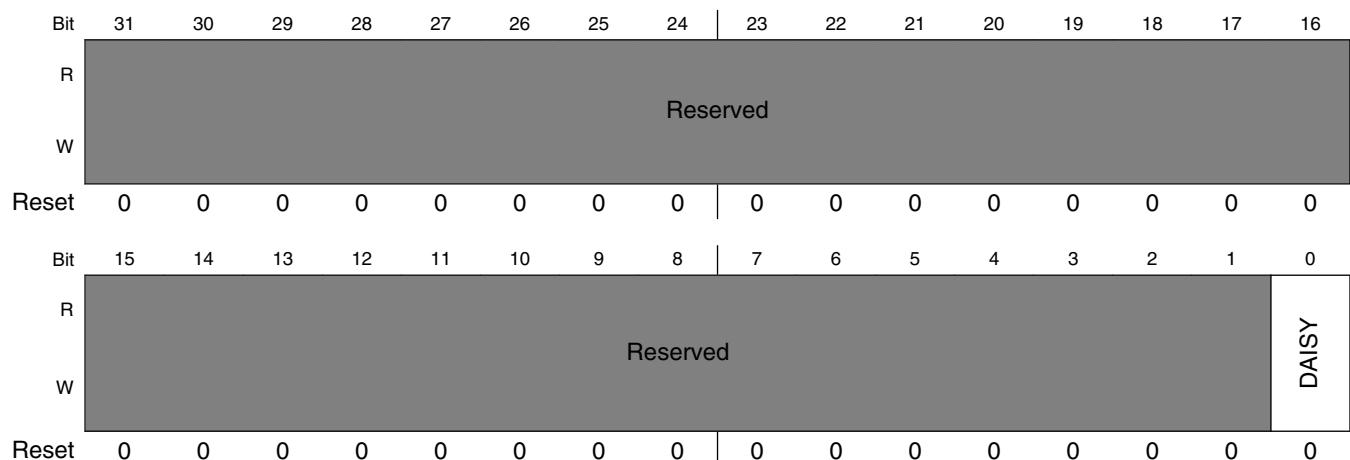

**IOMUXC\_LPSPI3\_SDO\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi3, In Pin: lpspi_sdo  1 <b>GPIO_AD_B1_14_ALT2</b> — Selecting Pad: GPIO_AD_B1_14 for Mode: ALT2 <b>pin 26</b> 0 <b>GPIO_AD_B0_01_ALT7</b> — Selecting Pad: GPIO_AD_B0_01 for Mode: ALT7

### 11.6.323 LPSPI4\_PCS0\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI4\_PCS0\_SELECT\_INPUT)

DAISY Register

Address: 401F\_8000h base + 51Ch offset = 401F\_851Ch

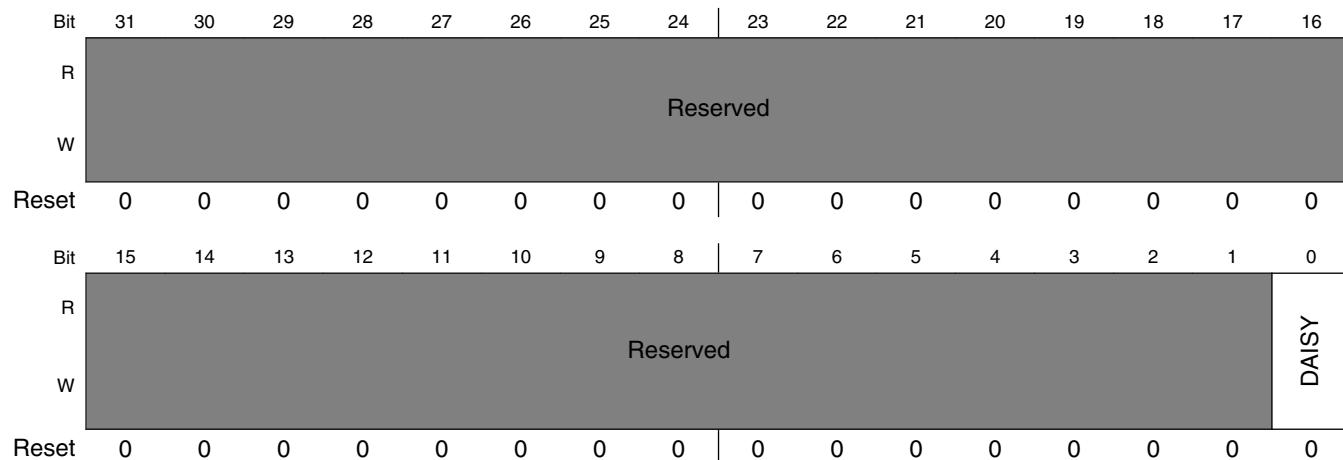

IOMUXC\_LPSPI4\_PCS0\_SELECT\_INPUT field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi4, In Pin: lpspi_pcs0  0 <b>GPIO_B0_00_ALT3</b> — Selecting Pad: GPIO_B0_00 for Mode: ALT3 <b>pin 10</b> 1 <b>GPIO_B1_04_ALT1</b> — Selecting Pad: GPIO_B1_04 for Mode: ALT1

### 11.6.324 LPSPI4\_SCK\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI4\_SCK\_SELECT\_INPUT)

DAISY Register

Address: 401F\_8000h base + 520h offset = 401F\_8520h

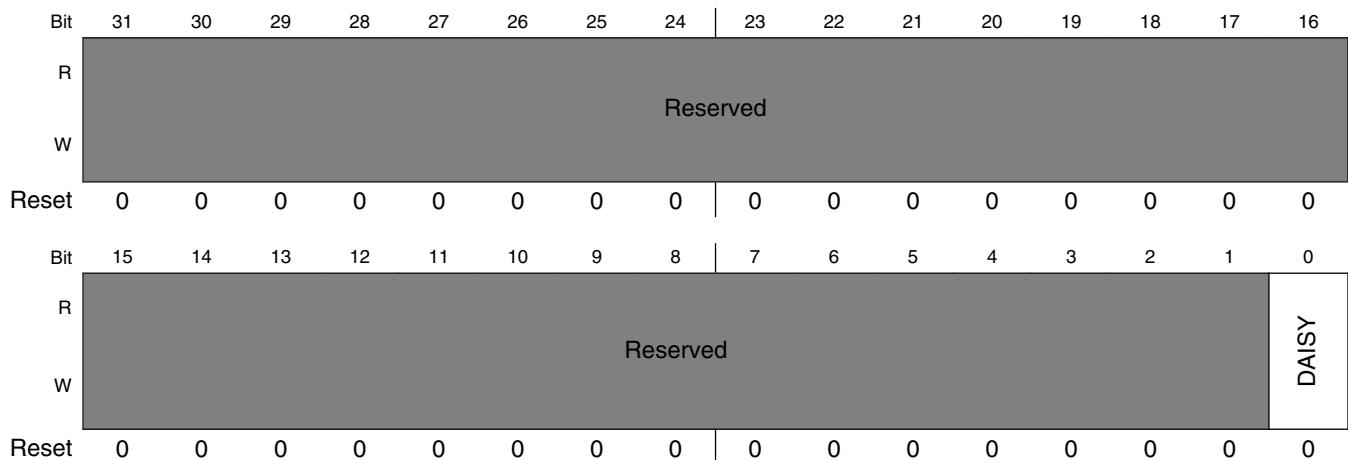

**IOMUXC\_LPSPI4\_SCK\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: lpspi4, In Pin: lpspi_sck  0 <b>GPIO_B0_03_ALT3</b> — Selecting Pad: GPIO_B0_03 for Mode: ALT3 <b>pin 13</b> 1 <b>GPIO_B1_07_ALT1</b> — Selecting Pad: GPIO_B1_07 for Mode: ALT1

### 11.6.325 LPSPI4\_SD1\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI4\_SD1\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 524h offset = 401F\_8524h

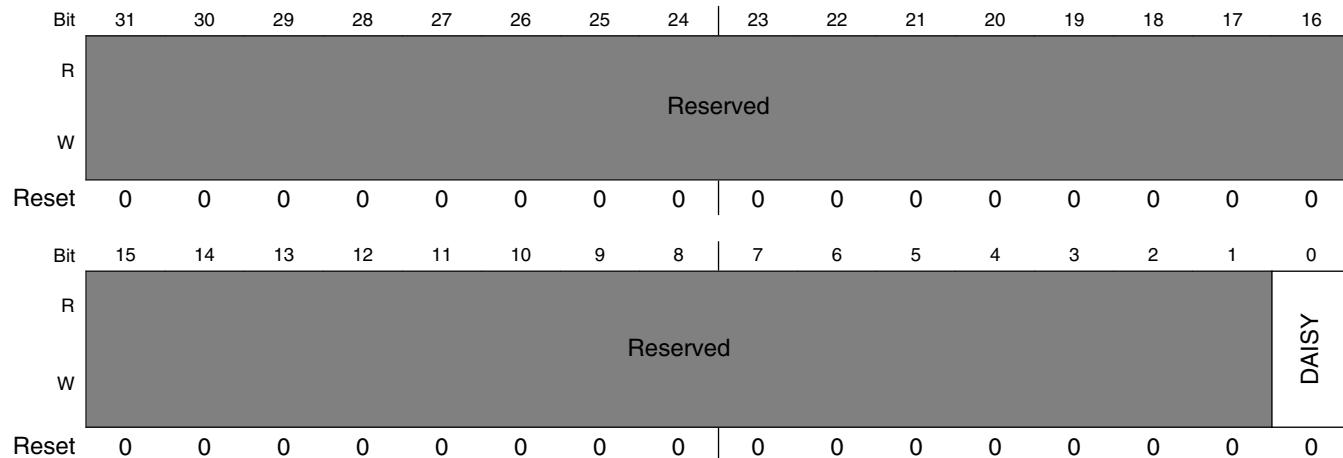

#### IOMUXC\_LPSPI4\_SD1\_SELECT\_INPUT field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: lpspi4, In Pin: lpspi_sdi  0 <b>GPIO_B0_01_ALT3</b> — Selecting Pad: GPIO_B0_01 for Mode: ALT3 <b>pin 12</b> 1 <b>GPIO_B1_05_ALT1</b> — Selecting Pad: GPIO_B1_05 for Mode: ALT1

### 11.6.326 LPSPI4\_SDO\_SELECT\_INPUT DAISY Register (IOMUXC\_LPSPI4\_SDO\_SELECT\_INPUT)

#### DAISY Register

Address: 401F\_8000h base + 528h offset = 401F\_8528h

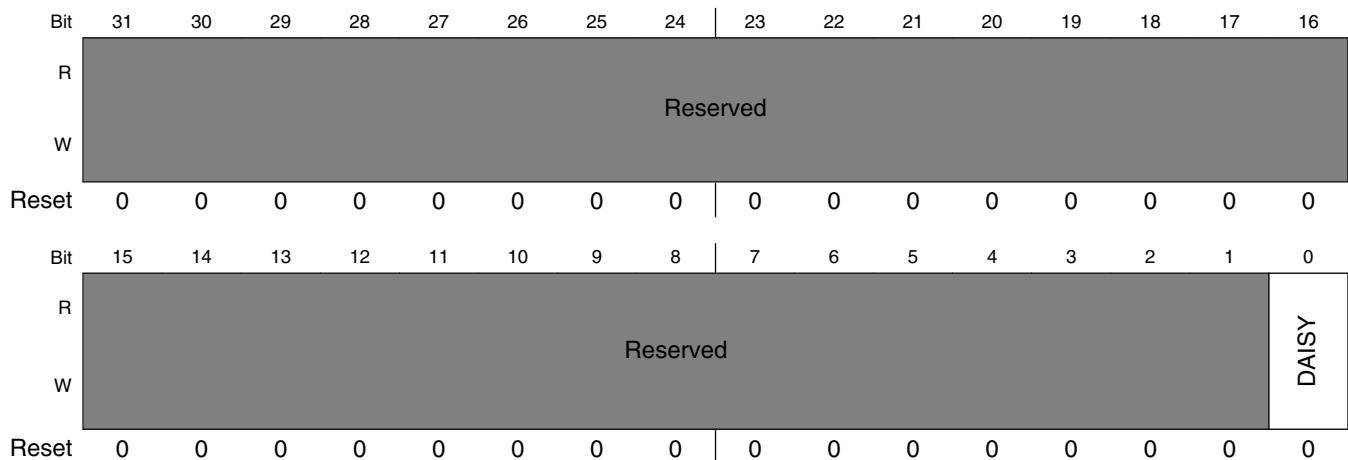

**IOMUXC\_LPSPI4\_SDO\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: lpspi4, In Pin: lpspi_sdo  0 <b>GPIO_B0_02_ALT3</b> — Selecting Pad: GPIO_B0_02 for Mode: ALT3 <b>pin 11</b> 1 <b>GPIO_B1_06_ALT1</b> — Selecting Pad: GPIO_B1_06 for Mode: ALT1

### 11.6.327 LPUART2\_RX\_SELECT\_INPUT DAISY Register (IOMUXC\_LPUART2\_RX\_SELECT\_INPUT)

DAISY Register

Address: 401F\_8000h base + 52Ch offset = 401F\_852Ch

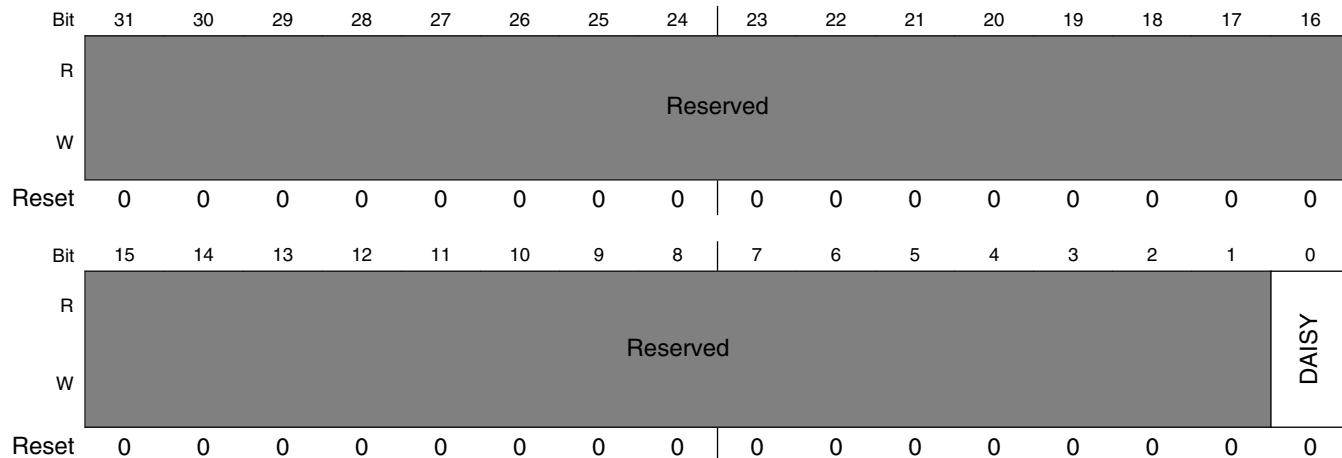

#### IOMUXC\_LPUART2\_RX\_SELECT\_INPUT field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain. Instance: Ipuart2, In Pin: Ipuart_rx  0 <b>GPIO_SD_B1_10_ALT2</b> — Selecting Pad: GPIO_SD_B1_10 for Mode: ALT2 1 <b>GPIO_AD_B1_03_ALT2</b> — Selecting Pad: GPIO_AD_B1_03 for Mode: ALT2 <b>pin 15</b>

### 11.6.328 LPUART2\_TX\_SELECT\_INPUT DAISY Register (IOMUXC\_LPUART2\_TX\_SELECT\_INPUT)

DAISY Register

Address: 401F\_8000h base + 530h offset = 401F\_8530h

**IOMUXC\_LPUART2\_TX\_SELECT\_INPUT field descriptions**

Field	Description
31–1 -	This field is reserved. Reserved
0 DAISY	Selecting Pads Involved in Daisy Chain.  Instance: Ipuart2, In Pin: Ipuart_tx  0 <b>GPIO_SD_B1_11_ALT2</b> — Selecting Pad: GPIO_SD_B1_11 for Mode: ALT2 1 <b>GPIO_AD_B1_02_ALT2</b> — Selecting Pad: GPIO_AD_B1_02 for Mode: ALT2 <b>pin 14</b>

High-speed GPIOs exist in this device.

- GPIO1-5 are standard-speed GPIOs that run off the IPG\_CLK\_ROOT, while GPIO6-9 are high-speed GPIOs that run at the AHB\_CLK\_ROOT frequency. See the table "System Clocks, Gating, and Override" in CCM chapter.
- Regular GPIO and high speed GPIO are paired (GPIO1 and GPIO6 share the same pins, GPIO2 and GPIO7 share, etc). The IOMUXC\_GPR\_GPR26-29 registers are used to determine if the regular or high-speed GPIO module is used for the GPIO pins on a given port.

Teensy startup code configures all pins to use fast GPIO6 - GPIO9. While this allows normal code to run much faster, the trade-off is no DMA access and all pins sharing a single pin change interrupt. For DMA access (as used by OctoWS2811 library) or special lower-latency interrupt response, individual pins can be configured to use of GPIO1 - GPIO4, but normal read / write access becomes much slower.

### 12.2 Overview

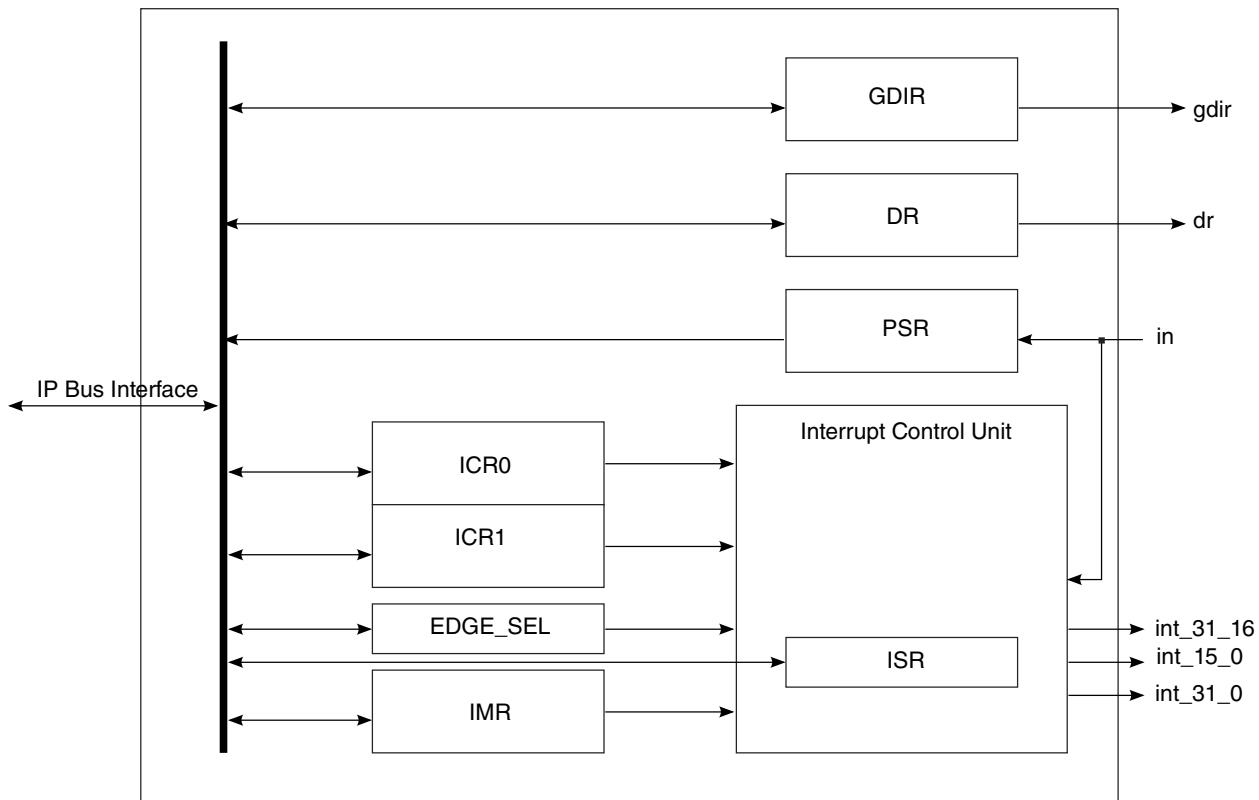

The General-Purpose Input/Output (GPIO) peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

## 12.2.1 Block Diagram

The GPIO subsystem contains multiple GPIO blocks, which can generate and control up to 32 signals for general purpose.

The block diagram for the GPIO block is provided below.

**Figure 12-1. GPIO Block Diagram**

## 12.2.2 Features

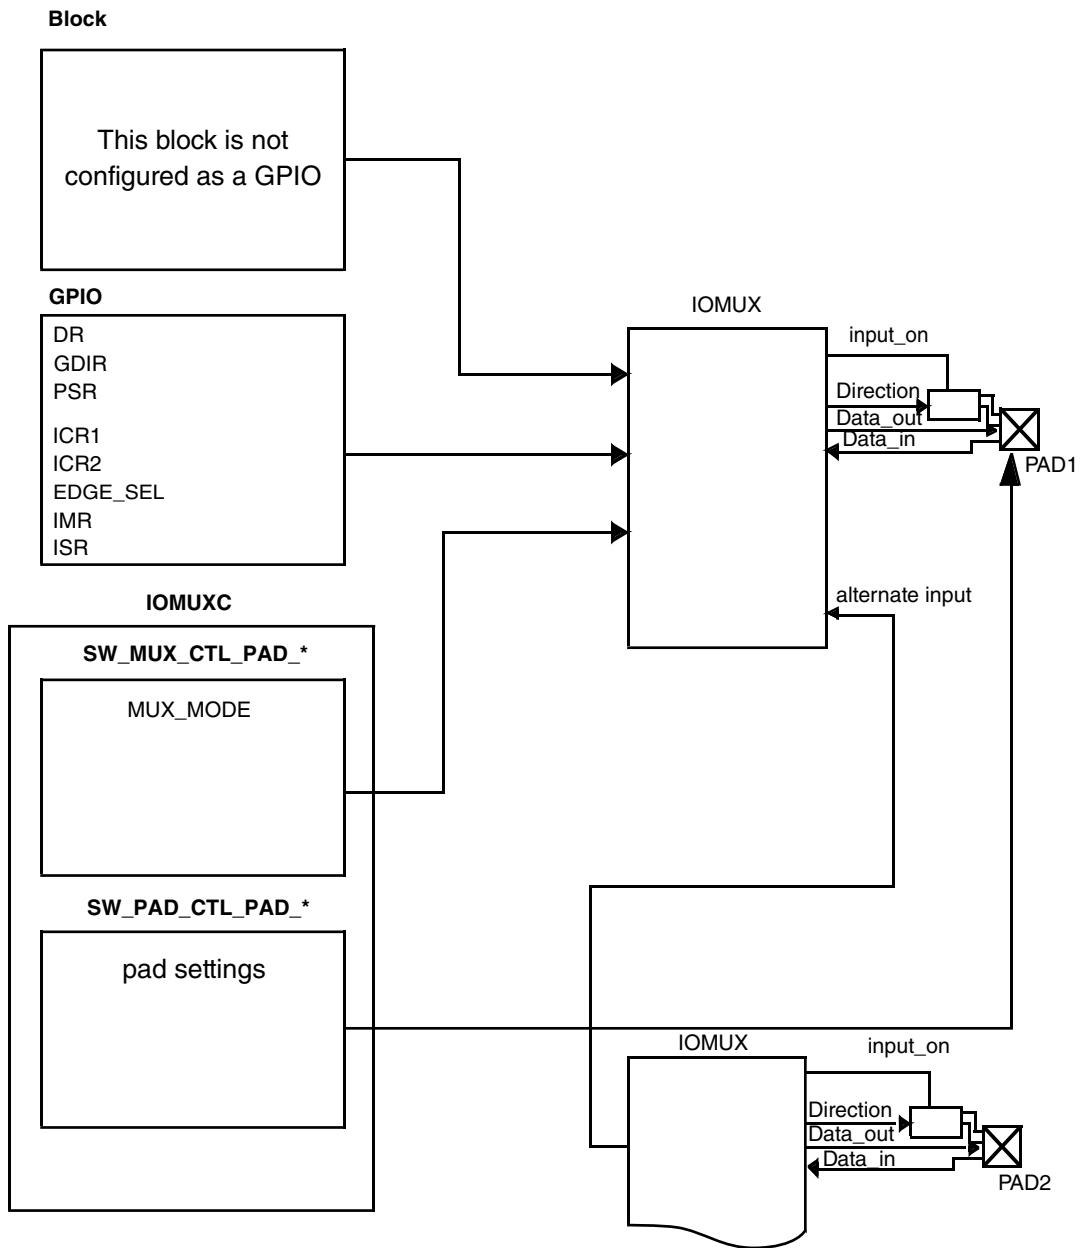

The GPIO includes the following features:

- General purpose input/output logic capabilities:
  - Drives specific data to output using the data register (DR)

- Controls the direction of the signal using the GPIO direction register (GDIR)
- Enables the core to sample the status of the corresponding inputs by reading the pad sample register (PSR).
- GPIO interrupt capabilities:
  - Supports 32 interrupts
  - Identifies interrupt edges
  - Generates three active-high interrupts to the SoC interrupt controller

## 12.3 Functional Description

The GPIO is one of the blocks controlling the IOMUX of the chip.

**Figure 12-2. Chip IOMUX Scheme**

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GDIR).

When configured as an output (GDIR[GDIR] = 1), the value in the data bit in the GPIO data register (DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GDIR[GDIR] = 0), the state of the input can be read from the corresponding PSR[PSR] bit.

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (DR)
- GPIO direction register (GDIR)
- Pad sample register (PSR)
- Interrupt control registers (ICR1, ICR2)
- Edge select register (EDGE\_SEL)
- Interrupt mask register (IMR)
- Interrupt status register (ISR)

The above registers are described in detail in the Register section.

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for n = 0 – 7). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in [Interrupt Control Unit](#).

### 12.3.1 GPIO pad structure

The functional diagram for the GPIO pad is provided below.

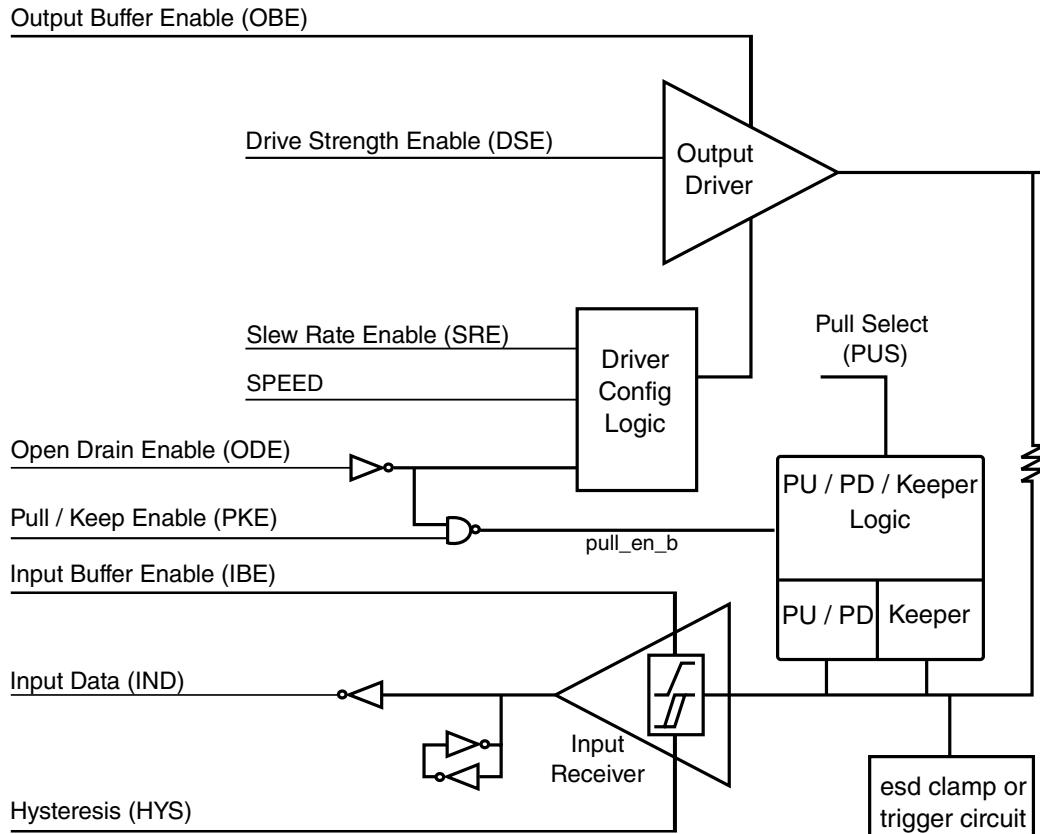

Figure 12-3. GPIO pad functional diagram

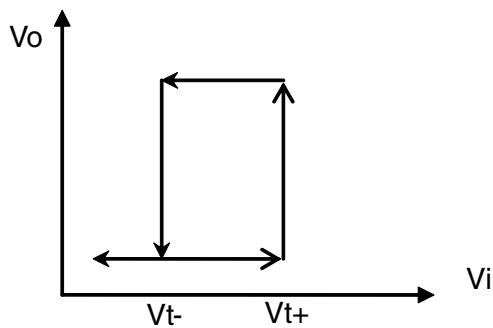

### 12.3.1.1 Input Driver

Input driver characteristics

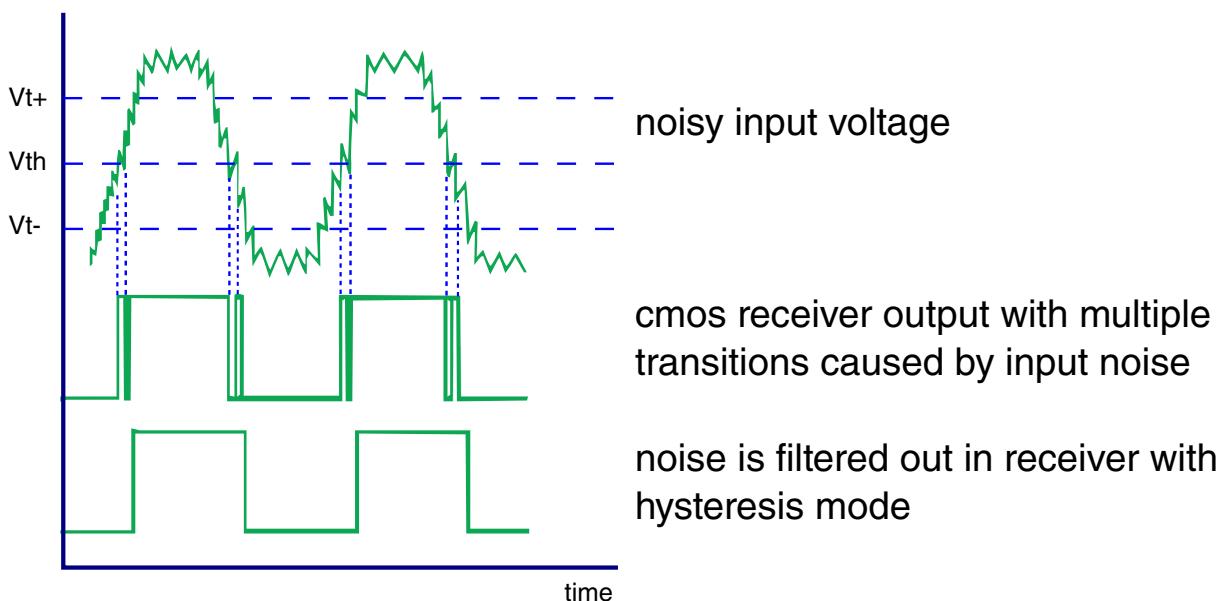

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. The keeper at the receiver output keeps its previous state.

#### 12.3.1.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

**Figure 12-4. Schmitt trigger transfer characteristic**

**Figure 12-5. Receiver output in CMOS and hysteresis**

### 12.3.1.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

### 12.3.1.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type

## Functional Description

- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

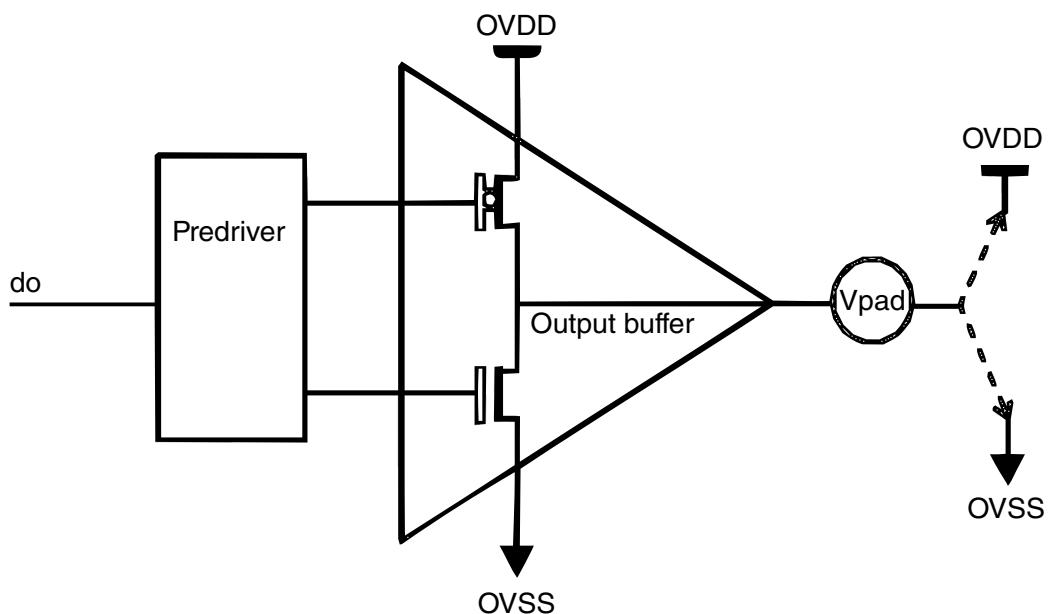

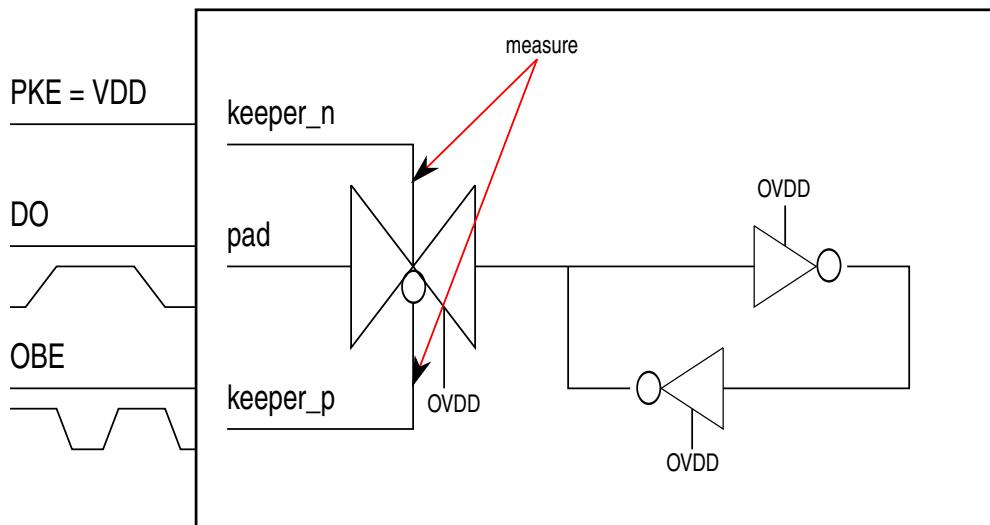

Figure 12-6. Output Driver Functional Diagram

### 12.3.1.2.1 Drive strength

Drive strength selection can be used to make the impedance matched and get better signal integrity.

### 12.3.1.2.2 Output keeper

A simple latch to hold the input value. The input value here refers to DO (data out), not data from PAD.

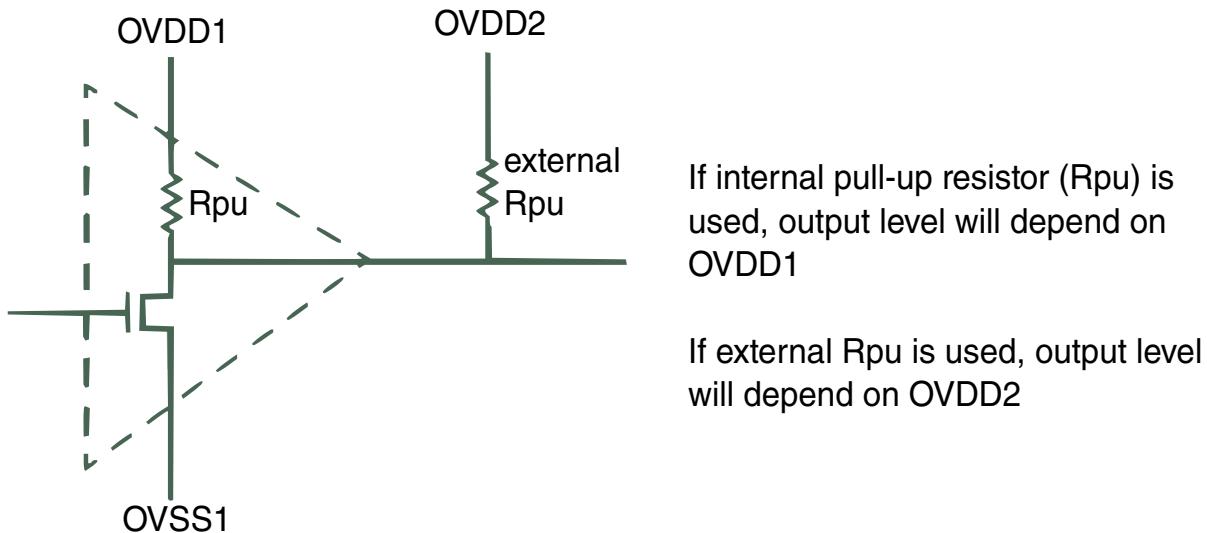

**Figure 12-7. Keeper functional diagram**

### 12.3.1.2.3 Pull-up (PU) / Pull-down (PD) / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

### 12.3.1.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communicate over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

**Figure 12-8. Output buffer in open drain mode**

### 12.3.1.3 Operating Frequency

**Table 12-2. IO Operating Frequency**

### 12.3.2 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR[GDIR] = 0). The interrupt control registers (ICR1 and ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about ICR1 and ICR2 settings, see the Register section.

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

### 12.3.3 Clocks

The following table describes the clock sources for GPIO. Please see the CCM for clock setting, configuration and gating information.

**Table 12-3. GPIO Clocks**

Clock name	Description
ipg_clk_s	Peripheral access clock

## 12.4 External Signals

The following table describes the external signals of GPIO.

**Table 12-4. GPIO External Signals**

Signal	Description
IOn	GPIO Signal

## 12.5 Application Information

### 12.5.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GDIR[GDIR] = 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4, input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

#### NOTE

While the GPIO direction is set to input (GDIR[GDIR] = 0), a read access to DR does not return DR data. Instead, it returns the PSR data, which is the corresponding input signal value.

### 12.5.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (via IOMUXC). If needed, enable SION to read the loopback pad value through PSR.
2. Configure GPIO direction register to output (GDIR[GDIR] = 1b).
3. Write value to data register (DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad_<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback to capture pad value into PSR in output mode
write sw_mux_ctl_pad_<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4, output3_bit, output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxxx5
```

## 12.6 Memory Map/Register Definition

This section includes the memory map and descriptions of all registers.

### 12.6.1 GPIO register descriptions

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

#### 12.6.1.1 GPIO memory map

GPIO1 base address: 401B\_8000h

GPIO2 base address: 401B\_C000h

GPIO3 base address: 401C\_0000h

GPIO4 base address: 401C\_4000h

GPIO5 base address: 400C\_0000h

GPIO6 base address: 4200\_0000h

GPIO7 base address: 4200\_4000h

GPIO8 base address: 4200\_8000h

GPIO9 base address: 4200\_C000h

Offset	Register	Width (In bits)	Access	Reset value
0h	GPIO data register (DR)	32	RW	0000_0000h
4h	GPIO direction register (GDIR)	32	RW	0000_0000h
8h	GPIO pad status register (PSR)	32	RO	0000_0000h
Ch	GPIO interrupt configuration register1 (ICR1)	32	RW	0000_0000h
10h	GPIO interrupt configuration register2 (ICR2)	32	RW	0000_0000h
14h	GPIO interrupt mask register (IMR)	32	RW	0000_0000h
18h	GPIO interrupt status register (ISR)	32	W1C	0000_0000h

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
1Ch	GPIO edge select register (EDGE_SEL)	32	RW	0000_0000h
84h	GPIO data register SET (DR_SET)	32	WO	0000_0000h
88h	GPIO data register CLEAR (DR_CLEAR)	32	WO	0000_0000h
8Ch	GPIO data register TOGGLE (DR_TOGGLE)	32	WO	0000_0000h

## 12.6.1.2 GPIO data register (DR)

### 12.6.1.2.1 Offset

Register	Offset
DR	0h

### 12.6.1.2.2 Function

The 32-bit DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of DR register reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

### 12.6.1.2.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 12.6.1.2.4 Fields

Field	Function
31-0 DR	<p>DR data bits</p> <p>This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading DR register returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0).</p> <p><b>NOTE:</b> The IOMUXC must be configured to GPIO mode for the DR register value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.</p>

## 12.6.1.3 GPIO direction register (GDIR)

### 12.6.1.3.1 Offset

Register	Offset
GDIR	4h

### 12.6.1.3.2 Function

The GDIR register functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

### 12.6.1.3.3 Diagram

### 12.6.1.3.4 Fields

Field	Function
31-0 GDIR	<p>GPIO direction bits</p> <p>Bit n of this register defines the direction of the GPIO[n] signal.</p> <p><b>NOTE:</b> The GDIR register affects only the direction of the I/O signal when the corresponding bit in the IOMUXC is configured for GPIO.</p> <p>0b - GPIO is configured as input. 1b - GPIO is configured as output.</p>

## 12.6.1.4 GPIO pad status register (PSR)

### 12.6.1.4.1 Offset

Register	Offset
PSR	8h

### 12.6.1.4.2 Function

The PSR register is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the ipg\_clk\_s clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

### 12.6.1.4.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

### 12.6.1.7.4 Fields

Field	Function
31-0 IMR	<p>Interrupt Mask bits</p> <p>This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.</p> <p>Bit IMR[n] (n=0...31) controls interrupt n as follows:</p> <ul style="list-style-type: none"> <li>0b - Interrupt n is disabled.</li> <li>1b - Interrupt n is enabled.</li> </ul>

## 12.6.1.8 GPIO interrupt status register (ISR)

### 12.6.1.8.1 Offset

Register	Offset
ISR	18h

### 12.6.1.8.2 Function

The ISR register functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

### 12.6.1.8.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

### 12.6.1.8.4 Fields

Field	Function
31-0	Interrupt status bits
ISR	<p>Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in IMR register.</p> <p>When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.</p>

## 12.6.1.9 GPIO edge select register (EDGE\_SEL)

### 12.6.1.9.1 Offset

Register	Offset
EDGE_SEL	1Ch

### 12.6.1.9.2 Function

The EDGE\_SEL register may be used to override the ICR registers' configuration. If the GPIO\_EDGE\_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

### 12.6.1.9.3 Diagram

# Chapter 13

## Clock and Power Management

### 13.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

### 13.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

## Device Power Management Architecture Components

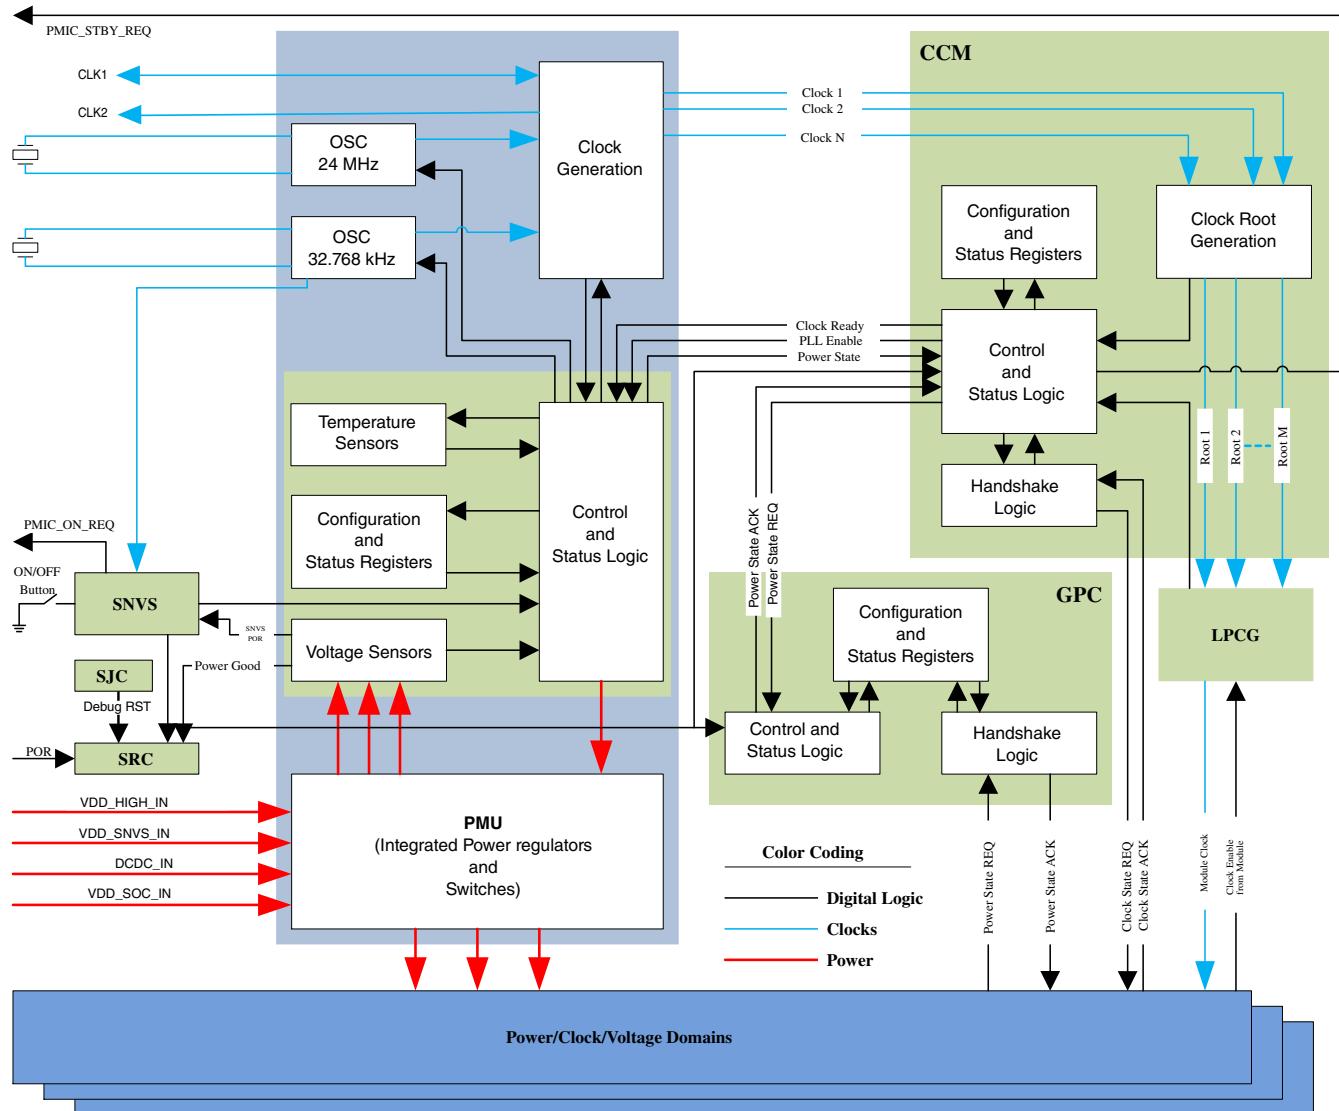

Figure 13-1. Power and clock management framework

### 13.2.1 Centralized components of clock generation and management

Centralized components of the clock generation and management sub-system are implemented in the following blocks:

- **CCM (Clock Control Module):** The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating. See [Clock Controller Module \(CCM\)](#) for

- information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

### 13.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management sub-system are implemented in the following blocks:

- Power Management Unit (PMU). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- General Power Controller (GPC). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.
- On Chip DC-DC regulator. See the DCDC chapter for more detailed information.

### 13.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the [System Reset Controller \(SRC\)](#).

### 13.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

#### NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

### 13.3 Clock Management

### 13.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

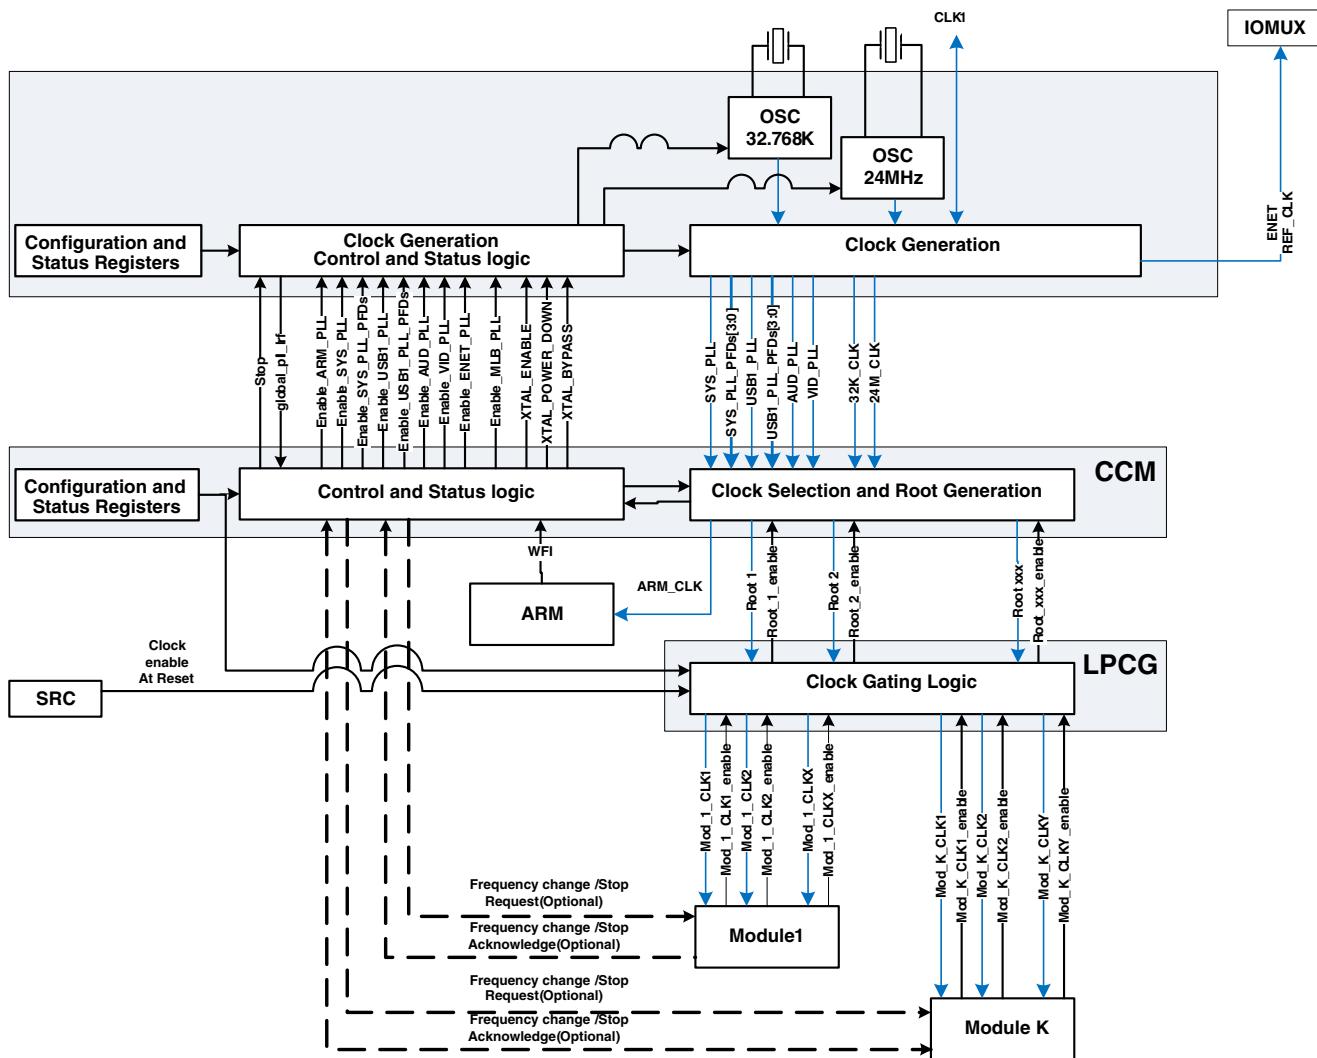

Figure 13-2. Clock Management System

### 13.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

### 13.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

#### NOTE

1. The 24 MHz XTALOSC can be the external clock source of SYSTICK. Hardware devides this down to 100KHz before it reaches SYSTICK.
2. If XTALOSC24M\_LOWPWR\_CTRLn[OSC\_SEL] is set to ROSC, the chip's 24MHz clock will be from the 24MHz RCOSC. In this case, the RCOSC should be enabled properly beforehand.

### 13.3.2.2 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

#### NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{VCO}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM\_PLL) - This is the PLL clocking the Arm core complex. It is a programmable integer frequency multiplier capable of output

frequency of up to 1.3 GHz. Note that this frequency is higher than the maximum chip supported frequency.

- PLL2 (also referred tp as System\_PLL or 528\_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. Besides the main output, this PLL drives four PFDs (PLL2\_PFD0...PLL2\_PFD3). The main PLL2 output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, SDRAM interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1\_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3\_PFD0...PLL3\_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL3 output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or16 from the PLL VCO frequency
- PLL6 (also referred to as ENET\_PLL) - This PLL implements a fixed 20+(5/6) multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
  - 50 or 25 MHz for the external ethernet interface.
  - 125 MHz for reduced gigabit ethernet interface.
  - 100 MHz for general purposes.
- PLL7 (also referred to as USB2\_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as OTG PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.

### 13.3.2.2.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the BYPASS\_CLK\_SRC field of the PLL control register. See [CCM Analog Memory Map/Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be clock un-gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at [www.nxp.com](http://www.nxp.com) for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

### 13.3.2.3 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- Arm core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

#### NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces, video and display interfaces, or general purpose serial interfaces (e.g. UART, CAN) may cause synchronization loss and should not be done.

### 13.3.2.4 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.

- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

### **13.3.3 Peripheral components of clock management system**

#### **13.3.3.1 Interface and functional clock**

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

### 13.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

#### 13.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of module supporting master clock protocol USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM\_CMEOR).

#### 13.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN, and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Overide Register (CCM\_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

### **13.3.3.3 Clock Domain(s)**

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

### **13.3.3.4 Domain level clock management**

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

### **13.3.3.5 Domain dependencies**

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

## 13.4 Power management

### 13.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks.

A high level block diagram of the power management system in the SoC environment is shown in the figure below.

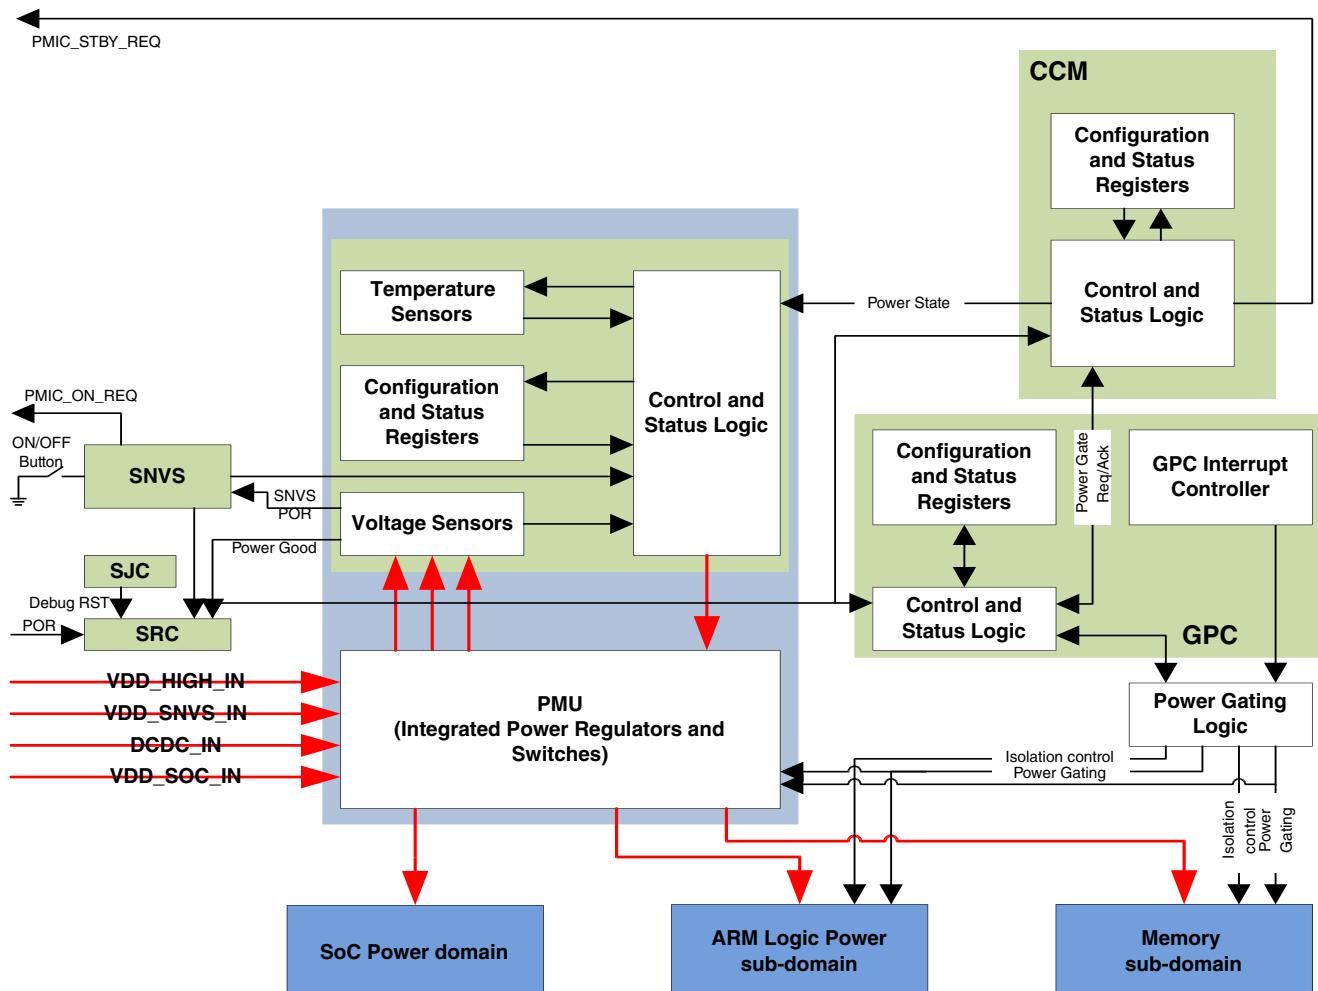

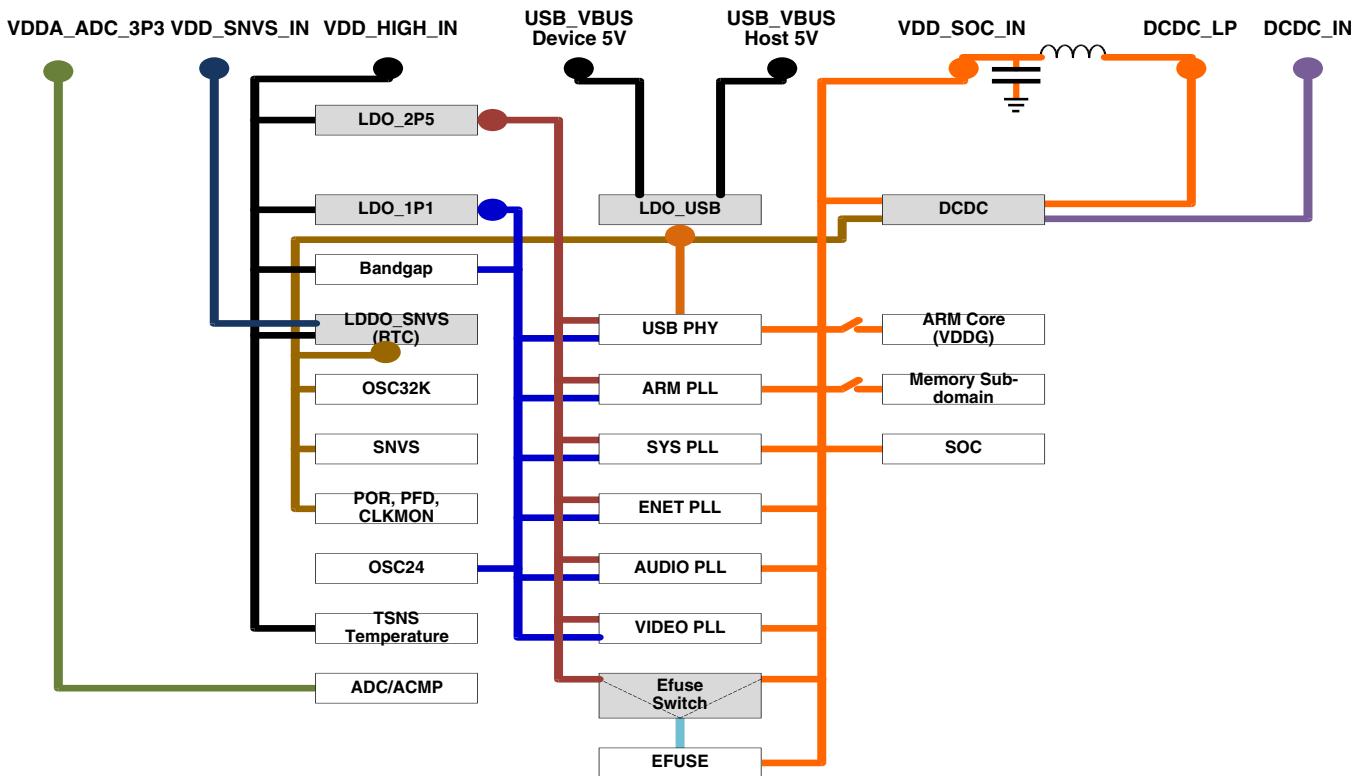

Figure 13-3. Power Management System

#### 13.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

## Power management

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

**Figure 13-4. SOC Power Tree**

The integrated PMU includes the following components:

- On-chip DCDC regulator
- Two Analog LDO regulators
- USB LDO
- SNVS regulator

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

### 13.4.1.1 DCDC Regulator

The DCDC regulator includes the following features:

- Adjustable (25 mV per step) high efficiency regulator
- Supports 3.3 V ( $\pm 10\%$ ) input voltage
- Output ranged in 0.9 V~1.3 V
- Supports nominal run, low power standby and off modes
- Supports 0.9 V~1.3 V output in run mode

- Supports 0.9 V~1.0 V output in standby mode
- Over current and over voltage detection

These modes allow the regulator to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

The DVFS (Dynamic Voltage and Frequency Scaling) in a typical cost/complexity optimized application is considered by means of an internal DCDC. The DCDC workpoint can be dynamically adjusted according to the system's working frequency requirement.

### 13.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO\_1P1 - The LDO\_1P1 (VDD\_HIGH\_IN, NVCC\_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.
- LDO\_2P5 - The LDO\_2P5 (VDD\_HIGH\_IN, VDD\_HIGH\_CAP) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 40Ohm. Special procedure is recommended to move load back and forth between the main and low power (weak) regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, and other analog and mix signal components integrated into the SoC.

### 13.4.1.1.3 USB LDO

The USB\_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

#### 13.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which in turn powers the real time clock and low power section of the SNVS modules. If VDDHIGH\_IN is present, then the SNVS\_IN supply is internally shorted to the VDDHIGH\_IN supply to allow coin cell recharging if necessary.

#### 13.4.1.2 GPC - General Power Controller

The GPC block includes the sub-blocks listed here.

- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and Memory sub-domain (PDRAMx).
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals.

Additional features are as follows:

- Supports up to 160 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

#### 13.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR\_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

#### 13.4.1.4 Power domain(s)

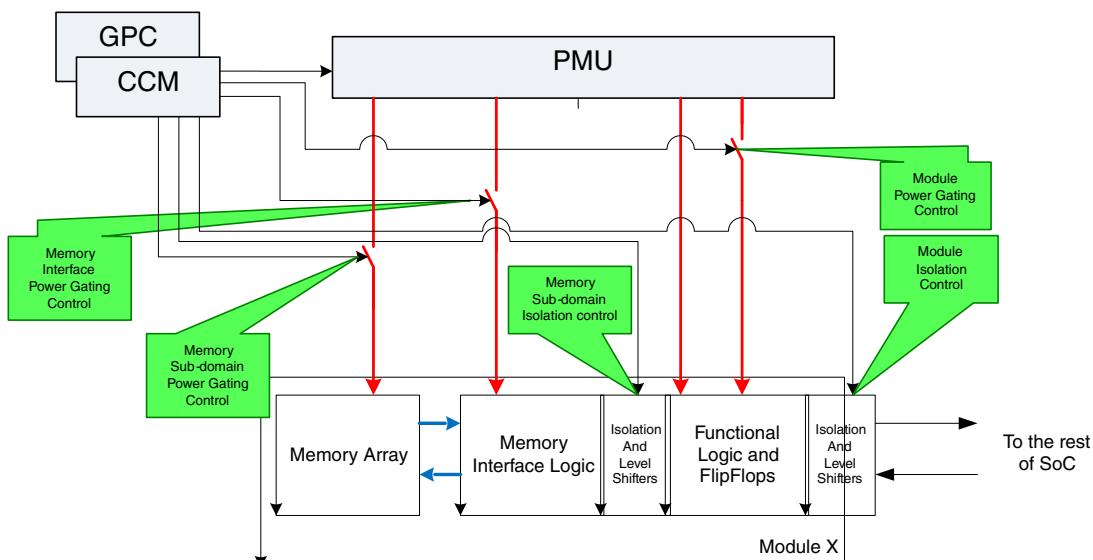

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

The following figure shows the power domain interface within the system.

**Figure 13-5. Power domain interface**

### 13.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- Arm - The Arm domain contains the Arm Core platform . This domain can be supplied from internal or external controllable regulator.
- FlexRAM memory array - Bank0 to Bank15 of FlexRAM.
- OCRAM2 memory array - The OCRAM2 memory array is partitioned into 2 sub-domains: 64KB always on domain (also known as PDRET domain, starting from address 2020\_0000h), 448KB PDRAM1 domain.
- SNVS/RTC low power domain - The SRTC (Secure Real Time Counter) domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply. This SNVS domain also contains Low Power State Retention (LPSR) GPIO, IOMUX, and LPSR general purpose register.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC. It is supplied by the same power supply as the Arm Core Platform.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Arm Core Platform - DVFS and power gating.
- FlexRAM memories - DVFS and power gating.
- PDRAM1 (within OCRAM2) memories - DVFS and power gating.
- Main SoC logic - DVFS, no power gating.

### 13.4.1.4.2 Domain memory and domain logic state retention in case of power gating

The following is the list of relevant memories and logic domains with the description of their state-retention support.

#### **NOTE**

For more detailed infomation, see the table "Low Power Mode Definition" in this chapter.

- Arm Core Platform logic - the software state retention for all logic is implemented in this domain and L1 cache memories. Software state retention means that the content

of relevant registers should be stored in some memory retaining its state (OCRAM for example) while the logic domain is power-gated.

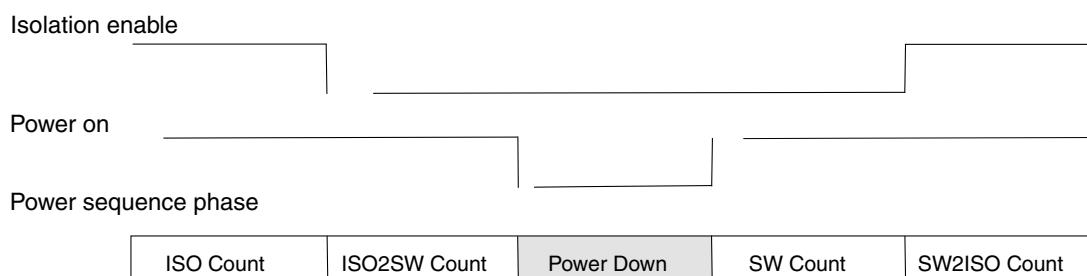

- PDRET memories - hardware state-retention in all power modes except SNVS mode.
- FlexRAM PDRAM0 memories - hardware state-retention . When Arm core is power gated, PDRAM0 memories can be either left on with its content retained or power gated together with the core.
- FlexRAM PDRAM1 memories - can be powered gated (together) independently of Arm core power gating.
- SoC - hardware state-retention .
- SNVS\_LP - hardware state-retention even when SoC supplies are removed.

### 13.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

#### 13.4.1.4.3.1 Arm Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
  - Configure the GPC/PGC PGC\_CPU\_PDNSCR Register ISO and ISO2SW bits. The ISO field determines the delay between the power-down request and enabling the platform isolation. The ISO2SW field determines the delay between the platform isolation and the actual power-off switch to the supplies.
  - Configure the GPC/PGC PGC\_CPU\_PUPSCR Register SW and SW2ISO bits. The SW field determines the delay between the power-up request and the actual power-up of the supplies. The SW2ISO field determines the delay between asserting power toggle and negating platform isolation.
  - Configure the GPC PGC PGC\_CPU\_CTRL PCR bit to allow the power down of the platform
  - Arm Core Platform should execute a "WFI" instruction.

**Figure 13-6. Arm Core Platform isolation and power on switch flow**

### 13.4.1.4.3.2 SoC

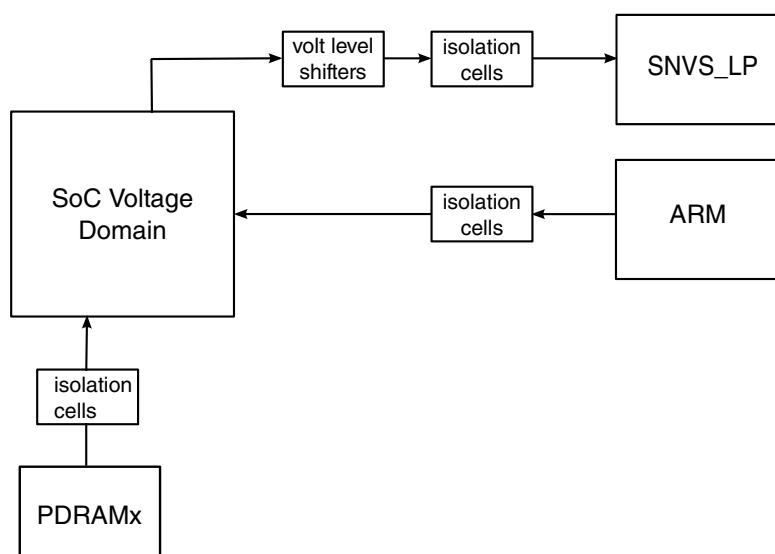

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM\_CCR[COSC\_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS\_LP is powered through an "always on" supply, configuring the SNVS\_LP DP\_EN to "1" allows changing the PMIC\_ON\_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

### 13.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Arm Core Platform and PDRAMx - Isolation needs to be enabled before power-down. This is taken care of automatically after CCM and PGC are configured and the Arm Core Platform executes the "WFI" instruction.
- SNVS\_LP - Different from the 2 domains above, the SNVS\_LP isolation isolates the signals coming from the SoC to the SNVS\_LP. This is required for saving the contents of the SNVS\_LP (such as the real-time clock). The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

**Figure 13-7. Isolation cells and Voltage level shifters placing**

### 13.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- SoC domain: including Core Platform, FlexRAM memories and SoC logic - Scalable voltage in both dynamic and static scenarios
- ANALOG components including PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS\_LP - Fixed voltage

### 13.4.1.6 Voltage domain management

#### 13.4.1.6.1 Dynamic

##### 13.4.1.6.1.1 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the Arm and SoC voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

#### 13.4.1.6.2 Static

##### 13.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM\_CCR), CCM Low Power Control Register (CCM\_CLPCR) and PMU Miscellaneous Register 0 (PMU\_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM\_CCR[RBC\_EN] bits to bypass and disable PMU regulators in the next Arm "WFI" execution.
- Configure CCM\_CCR[REG\_BYP\_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Arm Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode

### 13.4.1.7 System domains layout

The following table describes the different power modes.

For more information regarding the low-power application design points on i.MX RT series, see the application note [AN12085: How to use i.MX RT Low Power Feature](#).

#### NOTE

The IDLE, SUSPEND and SNVS are usually referred as low power mode.

- IDLE Modes: CPU in WFI state, some portion of the chip can be clock gated or power gated. The chip can wakeup from this mode from IRQ with a very short latency. IDLE mode is entered automatically from RUN mode when CPU executes WFI instruction, so the state of IDLE mode will have dependency on the state of the RUN mode. To avoid showing a lot of IDLE modes, the following two IDLE states are defined:
  - System IDLE: the IDLE mode entered from Low Speed Run mode. When entering from other RUN modes, the difference is mainly the CPU/Bus frequency.
  - Low Power IDLE: the IDLE mode entered from Low Power RUN mode.
- SUSPEND Mode: CPU power gated, all clocks gated only except 32KHz, analog modules also enter low power state. It provides the lowest power while keeps the system alive, but it would have longer exit time.
- SNVS Mode: All the modules are turned off, only except RTC is active.

**Table 13-1. Low Power Mode Definition**

	Overdrive Run	Full Speed Run	Low Power Run	System Idle	Low Power Idle	Suspend	SNVS
VDD_SOC_IN voltage	1.25V min	1.15V min	0.925V min	1.15V min	0.925V min	0.925V min	OFF
CCM LPM Mode	Run	Run	Run	WAIT	WAIT	STOP	N/A
Arm Core	up to 600 MHz	up to 528 MHz	up to 24 MHz	WFI	WFI	Powered down	OFF
AHB Clock	up to 600 MHz	up to 528 MHz	up to 24 MHz	up to 528 MHz	up to 24 MHz	OFF	OFF
IPG clock	up to 150 MHz	up to 132 MHz	up to 24 MHz	up to 132 MHz	up to 24 MHz	OFF	OFF
PER clock	up to 75 MHz	up to 72 MHz	up to 24 MHz	up to 72 MHz	up to 24 MHz	OFF	OFF
L1 Cache	ON	ON	ON	ON	ON	Powered down	OFF
PDRET	ON	ON	ON	ON	ON	ON	OFF
PDRAM0	ON	ON	ON	ON	ON	ON/OFF	OFF
PDRAM1	ON	ON	ON	ON/OFF	ON/OFF	OFF	OFF
System PLL	ON	ON	Powered down	ON	Powered down	Powered down	OFF
Other PLL	ON	ON	Powered down	Powered down	Powered down	Powered down	OFF
XTAL	ON	ON	OFF	ON	OFF	OFF	OFF
RC OSC	OFF	OFF	ON	OFF	ON	OFF	OFF
LDO2P5	ON	ON	OFF	ON	OFF	OFF	OFF
LDO1P1	ON	ON	OFF	ON	OFF	OFF	OFF

WEAK1P1	OFF	OFF	ON	OFF	ON	OFF	OFF
Bandgap	ON	ON	OFF	ON	OFF	OFF	OFF
Low Power Bandgap	ON	ON	ON	ON	ON	ON	OFF
Module clocks	ON as configured in CCM	OFF	OFF				
GPIO wakeup	N/A	N/A	N/A	Yes	Yes	Yes	Yes (1 pin only)
RTC wakeup	N/A	N/A	N/A	Yes	Yes	Yes	Yes
USB remote wakeup	N/A	N/A	N/A	Yes	Yes	Yes	No
Other wakeup source	N/A	N/A	N/A	Yes	Yes	No	No

There is a single hardware signal (stop\_mode) coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is controlled by the PMU\_MISC0[STOP\_MODE\_CONFIG] bit (See [PMU Memory Map/Register](#)

## Power management

**Definition**). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop\_mode signal. Blocks not described in the section below are unaffected by stop\_mode.

If the stop\_mode\_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop\_mode\_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

**Table 13-2. STOP mode configuration**

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration

### 13.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for Arm core) for preserving memory contents and device state in low-power modes
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

### 13.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

**Table 13-3. Power saving design/architecture and power saving techniques**

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	✓		
Arm Core Platform SRPG (Software)		✓	
Arm Core Platform Power Gating		✓	
Clock gating (automatic dynamic and forced)	✓		
Integrated PMU (IR drop, efficiency, accuracy)	✓		✓
C4 package (IR drop, thermal)	✓		
Display Backlight optimization (SW)			✓
Architecture: FlexRAM memories	✓		
Architecture: USB integration			✓
Low Power DRAM: SDRAM			✓

### 13.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the Arm domain as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

### 13.4.2.3 Peripheral Power management

#### 13.4.2.3.1 IO power reduction

Software configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)

### 13.4.2.4 Examples of External Power Supply Interface

This section presents the example of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented in the following figure. This scenario minimizes BoM and board design complexity.

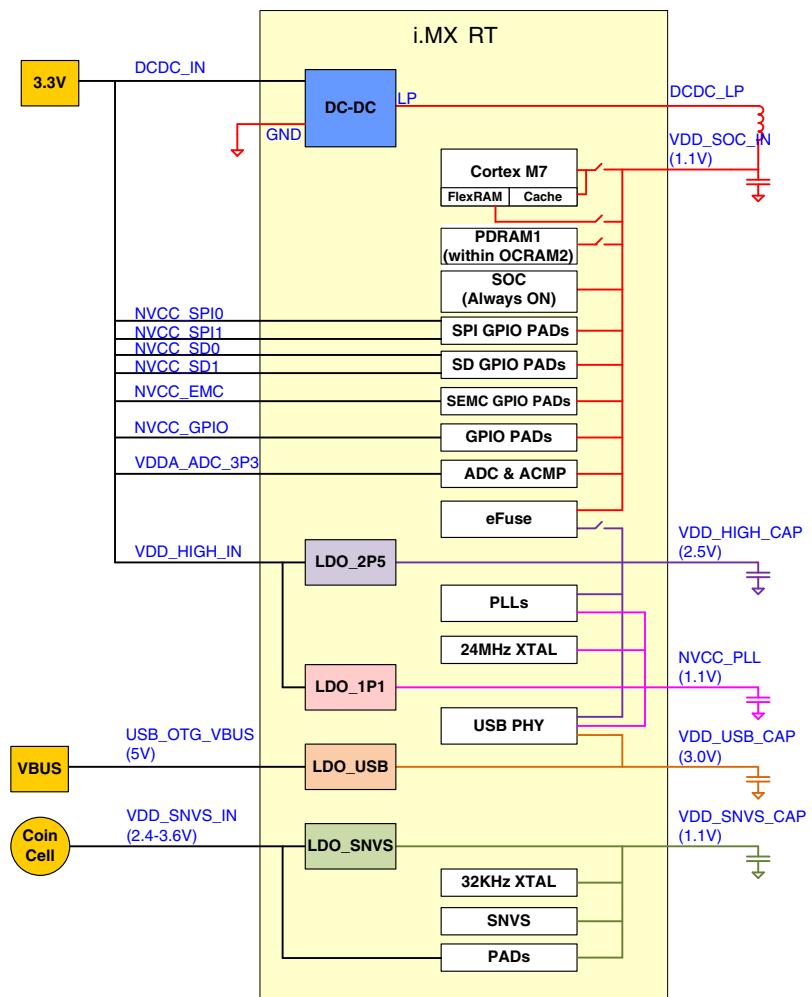

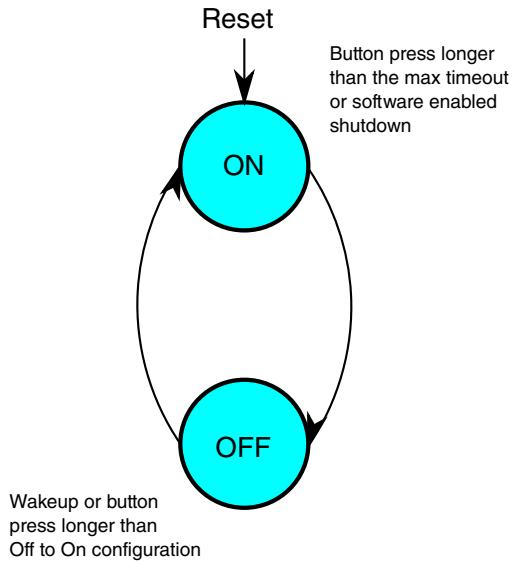

Figure 13-8. SOC Power Architecture

## 13.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The ONOFF logic inside of SNVS\_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a pmic\_en\_b and set\_pwr\_off\_irq signal. PMIC logic also supports the SNVS\_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

The Dumb PMIC mode uses a 2 state state machine, as shown below. The output of the pmic\_en\_b is generated by the state of the state machine.

**Figure 13-9. Dumb PMIC Mode State Machine**

The Dumb PMIC Mode uses pmic\_en\_b to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- Debounce: The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the set\_pwr\_off\_irq interrupt. While in the ON state and the button is pressed longer than the debounce time the set\_pwr\_off\_irq is generated.
- Off to On Time: The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. After the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- Max Timeout: The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The Smart PMIC mode is meant to connect to another PMIC. The pmic\_en\_b signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the set\_pwr\_off\_irq.

## 13.6 WAKEUP Pin

This chip supports the use of a WAKEUP pin (GPIO5\_IO00 ALT5) to request main SoC power on to exit SNVS mode. To use it, follow the tips below.

- SNVS must be in Dumb PMIC mode (*default*, and must for on-chip DCDC)
- Configure IOMUXC\_SNVS to select WAKEUP pin ALT5 to mux it to GPIO5\_IO00
- Configure GPIO5 ICR to either low level or high level sensitive
- Set GPIO5 IMR bit0 to enable GPIO5\_IO00 interrupt
- Enter SNVS mode by SW or ON/OFF button, then on-chip DCDC will be off, and PMIC\_ON\_REQ pin will also go to low to notify outside
- Assert WAKEUP pin for at least two 32 KHz cycles (active high or low depends on GPIO5 ICR configuration), so that GPIO5 interrupt gets sampled by SNVS module
- SNVS will assert PMIC\_ON\_REQ pin high and on-chip DCDC begins to ramp on
- SoC power on procedure (except SNVS) begins (ROM boot, ...)

# Chapter 14

## Clock Controller Module (CCM)

### 14.1 Chip-specific CCM information

Table 14-1. Reference links to related information

Topic	Related module(s)	Reference
System memory map	-	<a href="#">System Memory Map</a>
Clocking	CCM	<a href="#">Clock Management</a> <a href="#">Clock Control Module (CCM)</a>
Power management	PMU	<a href="#">Power Management</a> <a href="#">Power Management Unit</a>
Signal multiplexing	IOMUX	<a href="#">External Signals and Pin Multiplexing</a> <a href="#">IOMUX</a>
Interrupts, DMA Events and XBAR Assignments	-	<a href="#">Interrupts, DMA Events and XBAR Assignments</a>

#### NOTE

The OCRAM clock cannot be turned off when CM7 Cache is running, on this device. See [CCM\\_CGCR3\[CG14\]](#) bitfield.

System STOP/WAIT status can be observed on pin. See [CCM\\_STOP/CCM\\_WAIT](#) in the "Muxing Options" table of the [External Signals and Pin Multiplexing](#) chapter, for pin muxing details.

### 14.2 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of power gating operations.

## **14.2.1 Features**

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- Arm core root clock is generated from a dedicated source clock.
- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM\_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for Arm core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

## 14.2.2 CCM Block Diagram

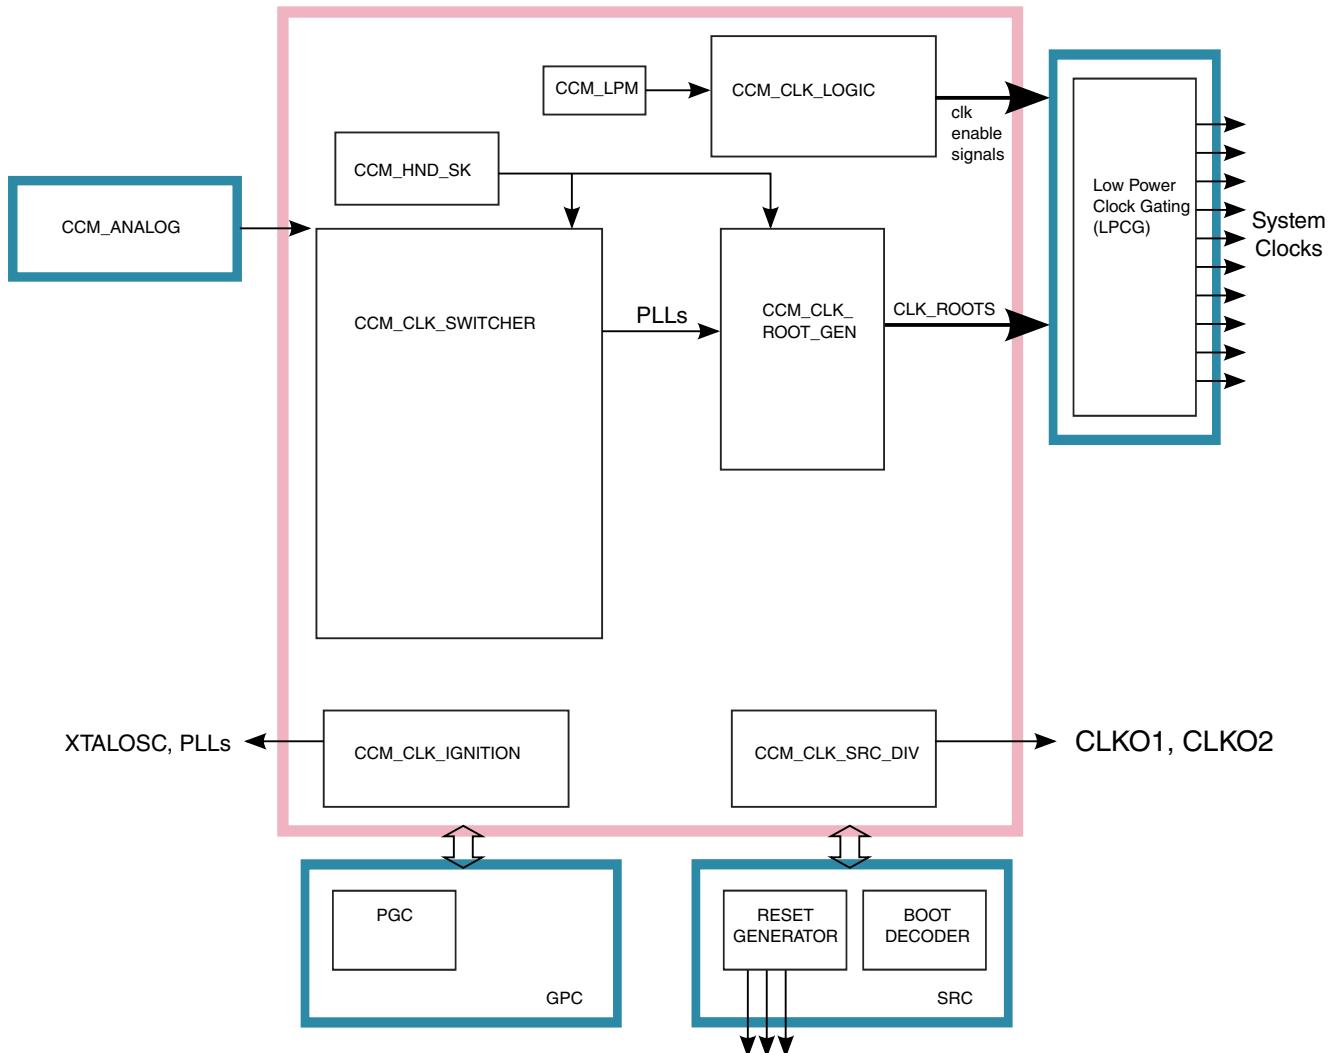

Figure 14-1. Block Diagram

CCM contains the following sub-blocks:

Table 14-2. CCM Sub-blocks

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality after CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates switcher clock outputs (pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.

Table continues on the next page...

**Table 14-2. CCM Sub-blocks (continued)**

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.
CCM_LPM	Manages the low power modes of the IC.
CCM_HND_SK	Manages the handshake when changing certain root clock dividers that require handshake.

## 14.3 External Signals

The following table describes the external signals of CCM:

**Table 14-3. CCM External Signals**

Signal	Description	Pad	Mode	Direction
CCM_REF_EN_B	Enable external reference clock (CKIH)	GPIO_SD_B1_07	ALT6	O
CCM_CLKO1	Observability clock 1 output	GPIO_SD_B0_04	ALT6	O
CCM_CLKO2	Observability clock 2 output	GPIO_SD_B0_05	ALT6	O
CCM_PMIC_STBY_REQ	Signal coming from PMIC to indicate that the voltage started to change in PMIC_STBY_REQ. CCM will ignore this indication if CLPCR [BYPASS_PMIC_READY] is set.	PMIC_STBY_REQ	ALT0	I
CCM_PMIC_READY	Signal goes to STANBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	GPIO_AD_B0_12 GPIO_EMC_32 GPIO_AD_B1_08 GPIO_AD_B1_01 GPIO_SD_B1_03	ALT1 ALT3 ALT3 ALT4 ALT6	O O O O O

## 14.4 CCM Clock Tree

The following figures (Part 1 and Part 2) show the clock tree configuration and clock roots for CCM.

For detailed sub-block information, see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

### NOTE

The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree diagram that follows. The PLLs and PFDs control registers may be reprogrammed according to the speed grade of the SoC being used, but should not exceed that maximum setting for that speed grade.

## CCM Clock Tree

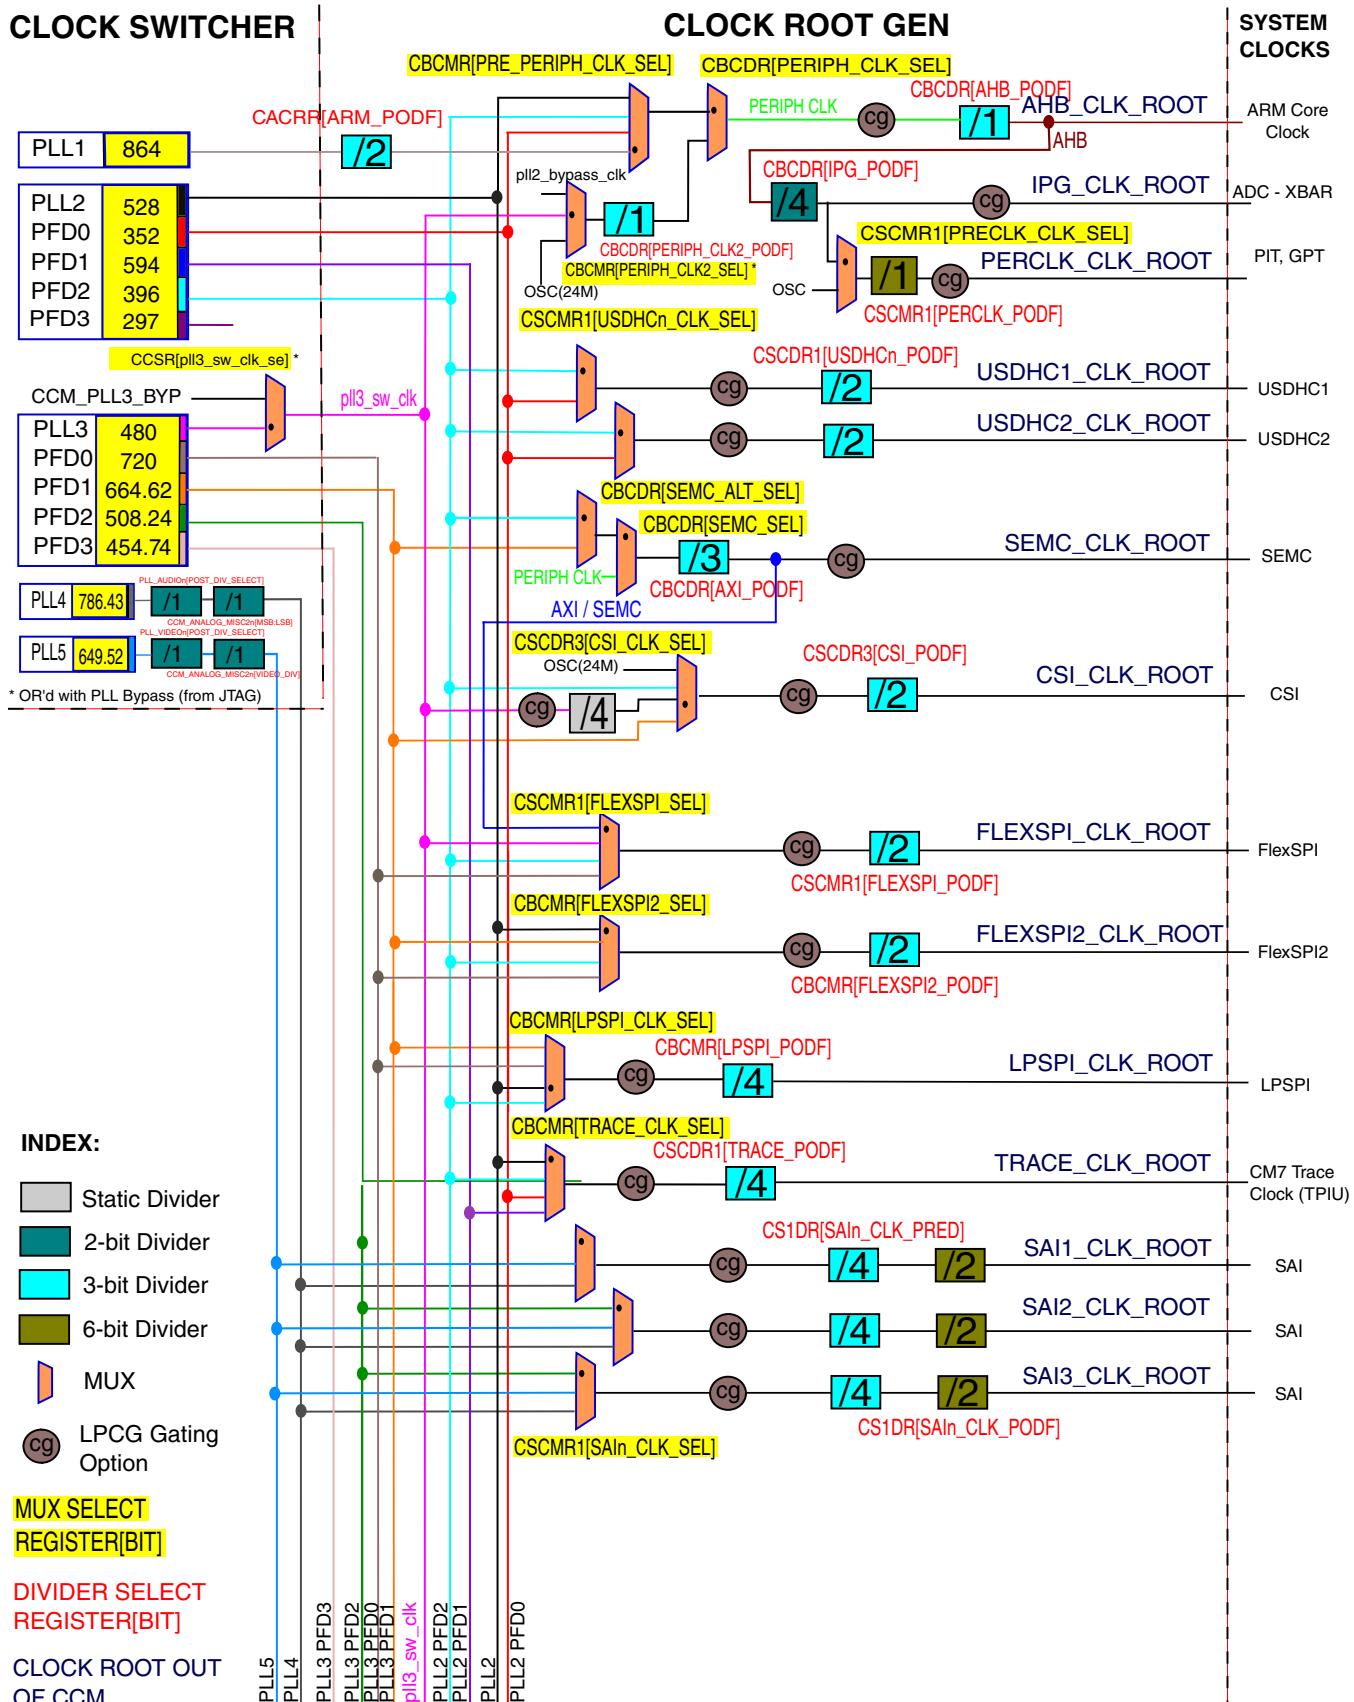

Figure 14-2. Clock Tree - Part 1

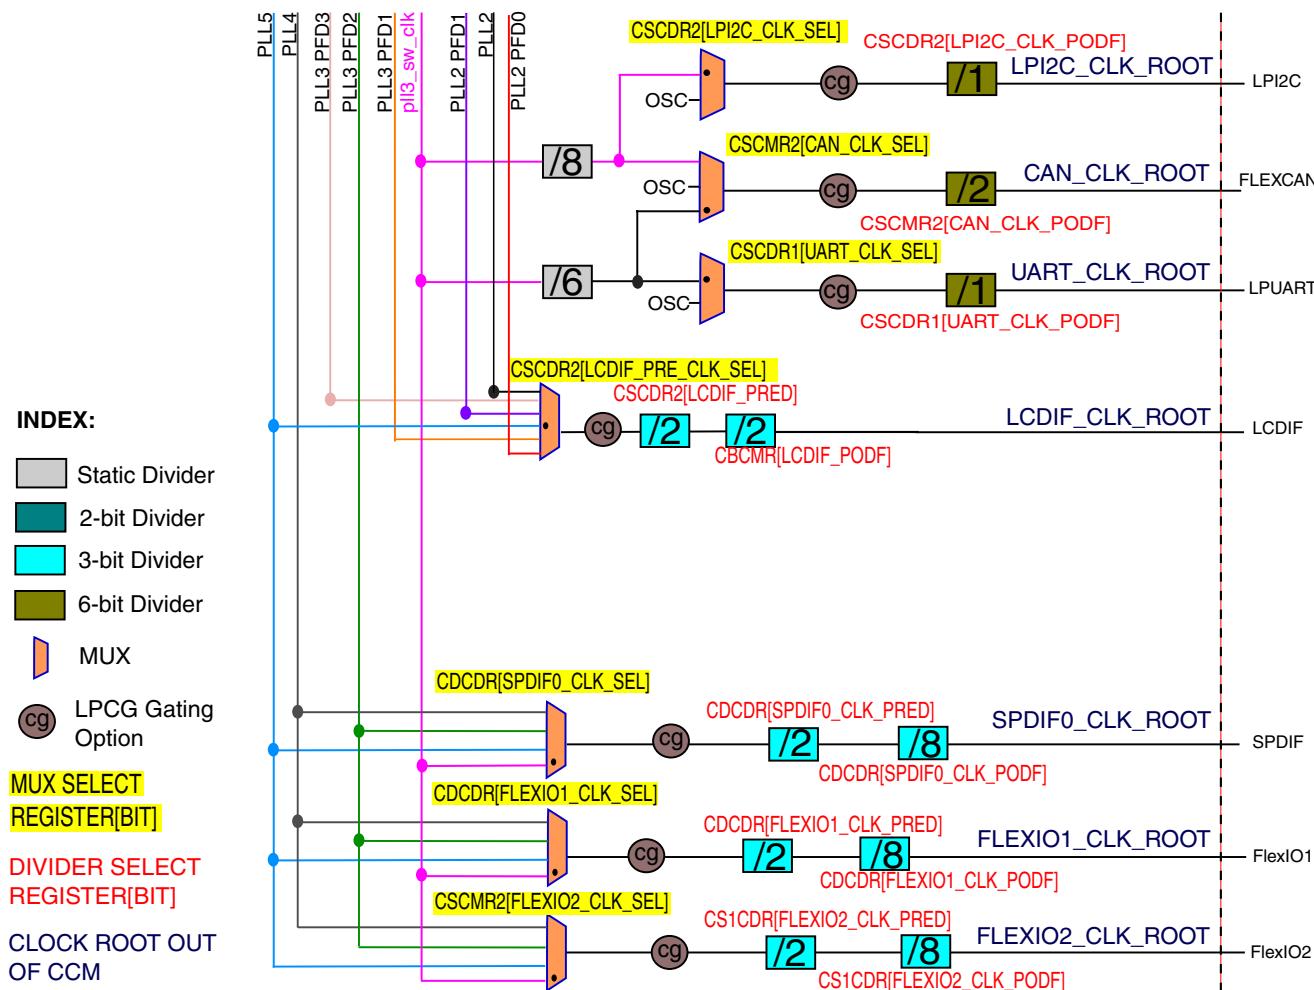

Figure 14-3. Clock Tree - Part 2

**NOTE**

In this device, the clock root for FlexIO3 is also flexio2\_clk\_root, and the bitfield of clock selector/divider is shared for FlexIO2/FlexIO3.

## 14.5 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

## System Clocks

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

**Table 14-4. System Clocks, Gating, and Override**

Module	Module Clock	Clock Root	Module Clock Gating Enable	Module Override Enable
ACMP <i>n</i>	acmp1 clocks	ipg_clk_root	CCGR3[CG10] (acmp1_clk_enable)

## 14.6 Functional Description

This section provides a complete functional description of the block.

### 14.6.1 Clock Generation

### 14.6.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG\_CLK and supplied to modules that need it.

#### 14.6.1.1.1 CKIL synchronizing to IPG\_CLK

CKIL is synchronized to ipg\_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG\_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

### 14.6.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

#### 14.6.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency )

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/Register Definition](#) for register information.

### 14.6.1.3.1 ARM PLL (PLL1)

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM\_ANALOG\_PLL\_ARM[DIV\_SELECT].

$$\text{PLL output frequency} = \text{Fref} * \text{DIV\_SEL}/2$$

#### NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

### 14.6.1.3.2 System PLL (PLL2)

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 4 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM\_ANALOG\_PLL\_SYS\_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}{\text{CCM\_ANALOG\_PLL\_SYS\_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM\_ANALOG\_PLL\_SYS\_SS[STEP]}}{2 \times \text{CCM\_ANALOG\_PLL\_SYS\_SS[STOP]}}$$

Although this PLL does have a DIV\_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

This PLL also supports a Fractional-N synthesizer.

### 14.6.1.3.3 USB1 PLL (PLL3)

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV\_SELECT register field, this PLL should always be set to 480 MHz in normal operation.

### 14.6.1.3.4 Audio PLL (PLL4)

The audio PLL synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_AUDIO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV\_SELECT} + \text{NUM/DENOM})$$

### 14.6.1.3.5 Video PLL (PLL5)

The video PLL synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_VIDEO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV\_SELECT} + \text{NUM/DENOM})$$

### 14.6.1.3.6 Ethernet PLL (PLL6)

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The reference clocks generated by this PLL are:

- ref\_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM\_ANALOG\_PLL\_ENET[DIV\_SELECT] bitfield
- ref\_enetpll2 fixed at 25 MHz

### 14.6.1.3.7 USB2 PLL (PLL7)

USB2 PLL is only used by the USB UTM interface through a direct connection.

### 14.6.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to  $F_{VCO} * 18/N$ , N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL regrogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at [www.nxp.com](http://www.nxp.com) for procedure details.

### 14.6.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM\_CLK\_SWITCHER

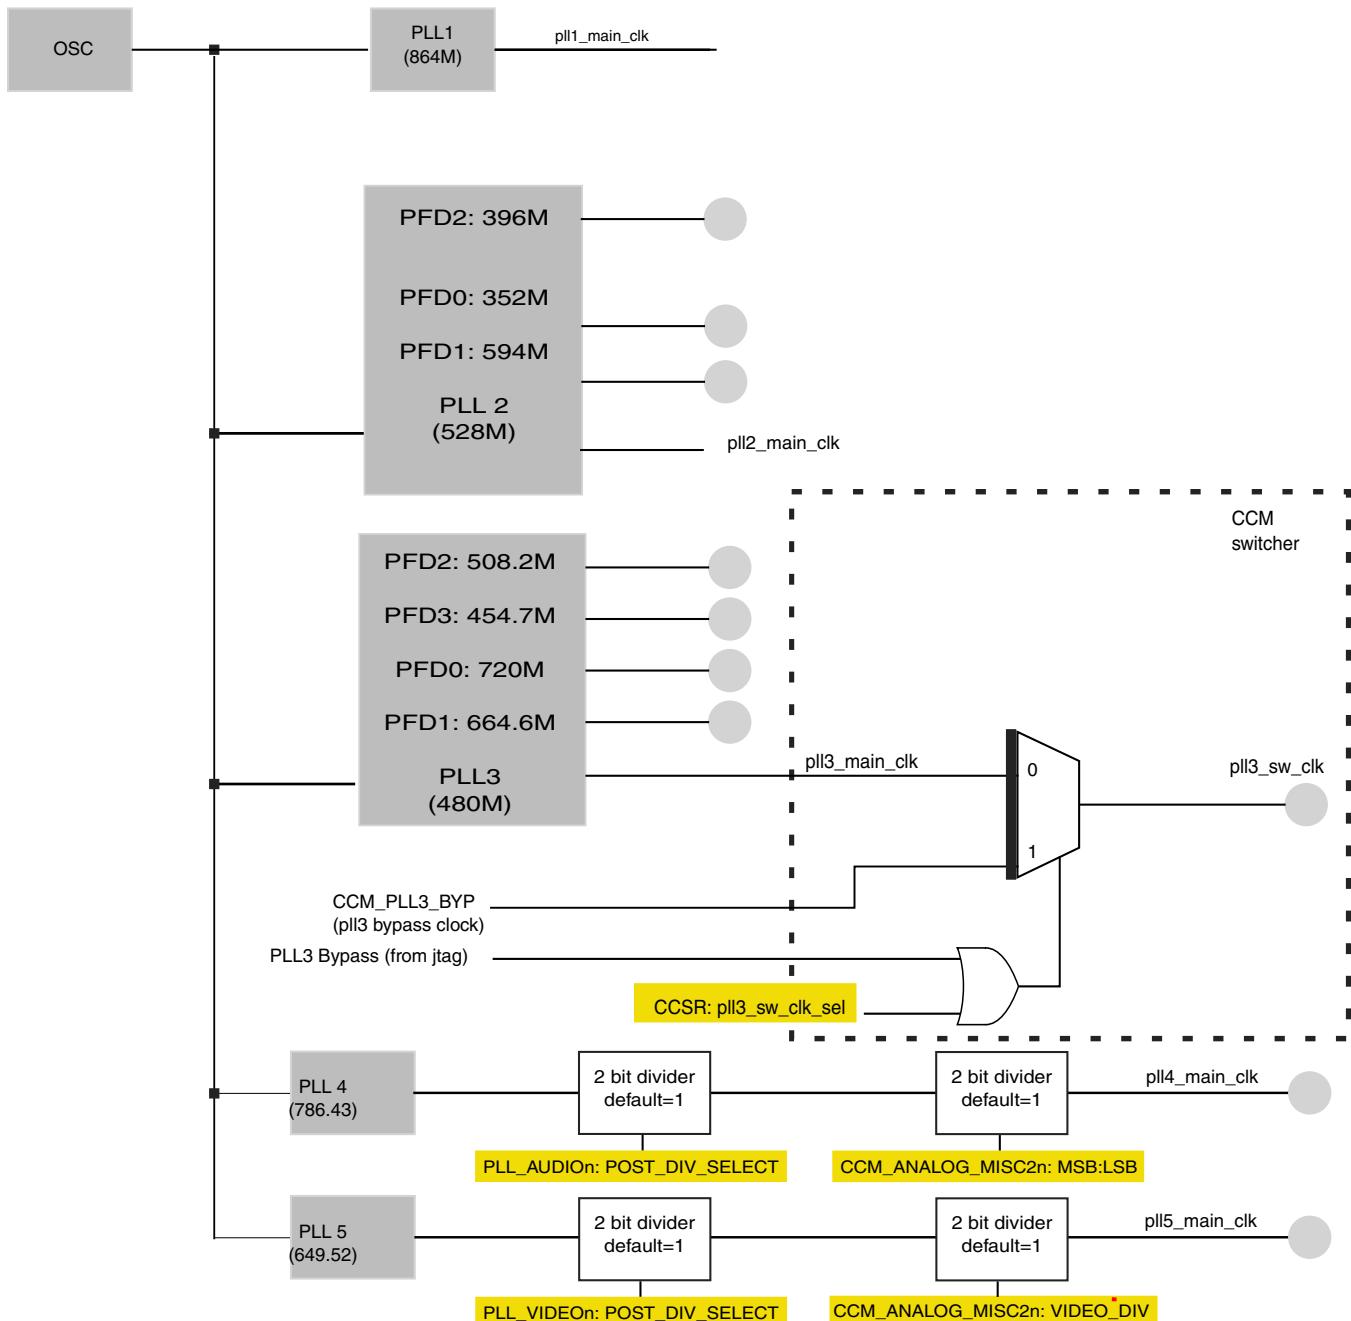

CCM\_CLK\_ROOT\_GEN

#### 14.6.1.5.1 Clock Switcher

The Clock Switcher (CCM\_CLK\_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 14-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

**Figure 14-4. Switcher clock generation**

### 14.6.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM\_ANALOG module, switcher and clk\_root\_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

### **14.6.1.5.3 PLL clock change**

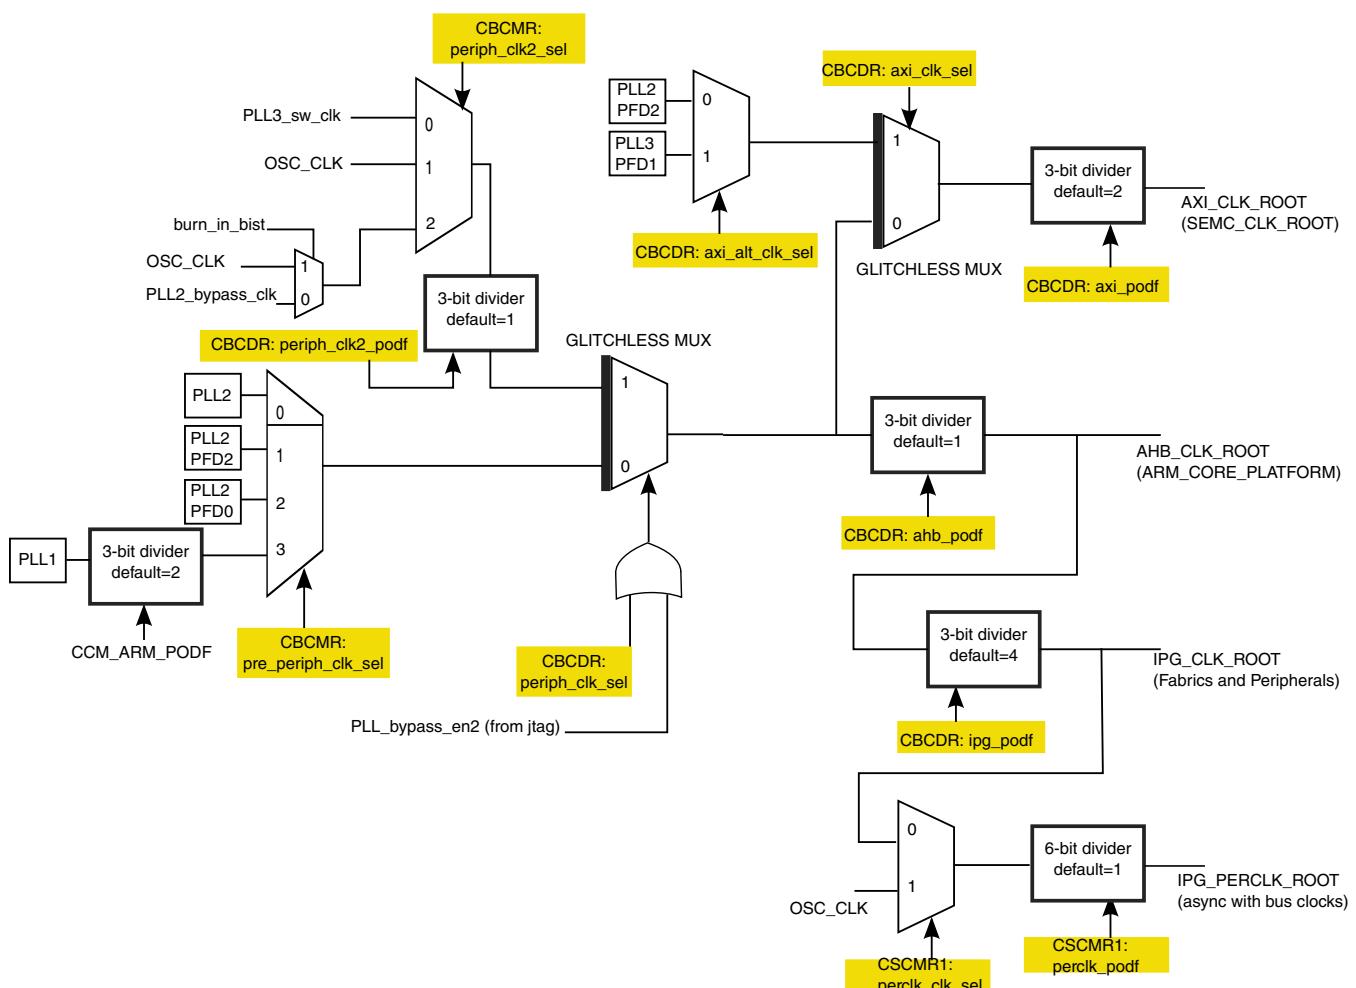

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

#### 14.6.1.5.4 Clock Root Generator

The Clock Root Generator (CCM\_CLK\_ROOT\_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parentheses are the default typical frequencies.

**Figure 14-5. BUS clock generation**

**NOTE**

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

**14.6.1.5.5 Divider change handshake**

Modifying the following dividers will start the handshake .

- periph\_clk\_sel
- arm\_podf
- ahb\_podf

The dividers listed above are designed with a handshake. For dividers without a handshake design, the following sequence must be performed when updating PODF value:

1. Gate the output clock off before updating PODF value.
2. Gate the output clock on after the PODF value is updated and stable.

To update the PODF value without gating the output clock off will cause unpredictable results such as no clock output.

**14.6.1.6 Disabling / Enabling PLLs**

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

**14.6.1.7 Clock Switching Multiplexers**

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM uses several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. For the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are several glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

**Table 14-6. Glitchless Multiplexers**

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
semc_clk_mux	CBCDR[semc_clk_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	

### NOTE

Any change of the periph\_clk\_sel sync mux select will involve handshake. Refer to the CDHIPR register for the handshake busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 14-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the AHB\_CLK\_ROOT away from the PLL2 or one of its PFDs by programming CBCMR[PERIPH\_CLK2\_SEL] and CBCDR[PERIPH\_CLK2\_PODF] to provide an appropriate frequency clock, then glitchlessly switch to it by programming CBCDR[PERIPH\_CLK\_SEL].

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The output clocks to the mux are required to be gated before switching the source clock in the CCM clock mux. If the output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

### 14.6.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

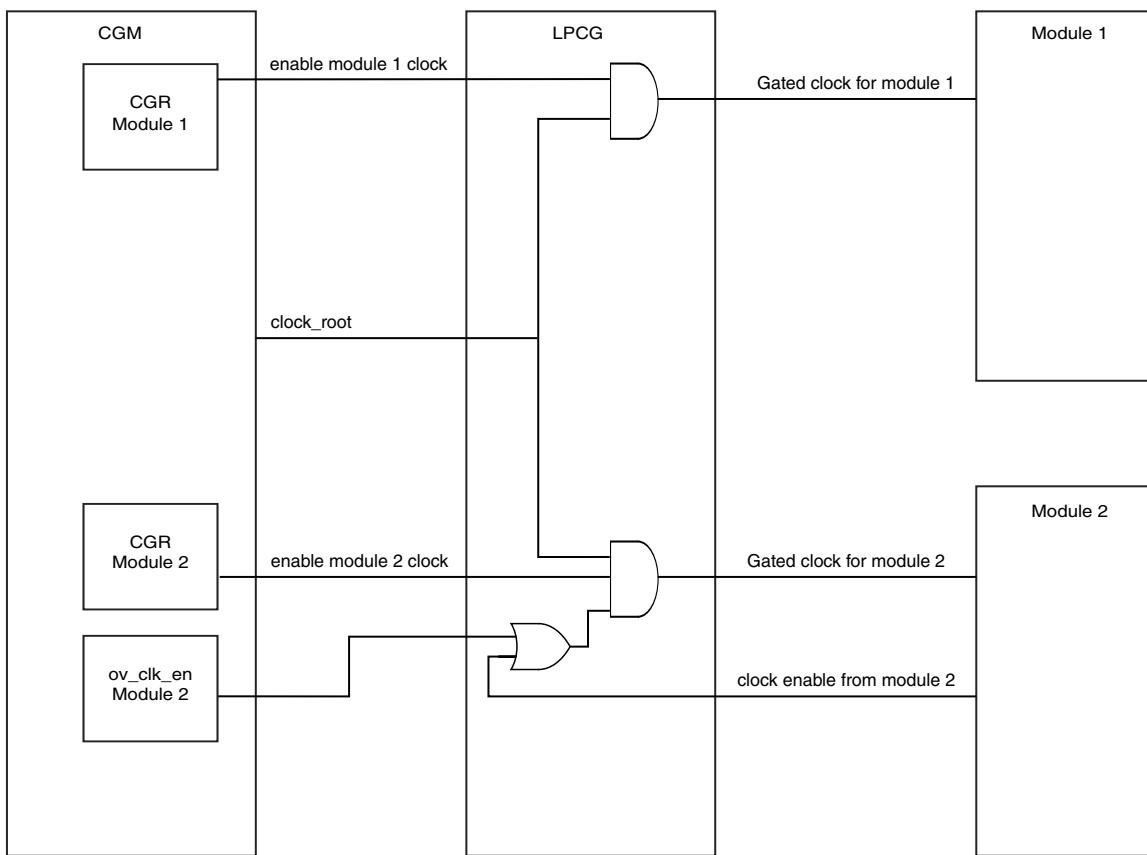

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programmable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

**Figure 14-6. Clock split in LPCG**

## 14.6.2 DVFS support

When performing DVFS, the frequency shift procedure for the Arm core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM\_ANALOG module.

### NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

### NOTE

CCM\_ANALOG will not control the voltage value in Bypass mode

### 14.6.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

#### 14.6.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

#### 14.6.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all Arm cores are in WFI, and L2 cache and SCU are idle.

##### 14.6.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. After CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

Any enabled interrupt assertion will start the exit from WAIT mode.

### 14.6.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

### 14.6.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for Arm platform. External supply voltage can be reduced to decrease leakage.

#### 14.6.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM\_PMIC\_STBY\_REQ asserted, if vstby bit is set
- osc\_en signal is negated
- osc\_pwrdown is asserted, if sbyos bit is set

Counter will be triggered after CCM\_PMIC\_STBY\_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop\_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP\_GPC until STOP mode is exited.

#### 14.6.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC\_STBY\_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref\_en\_b signal and deasserting cosc\_pwrdown signal respectively.

3. After the number of cycles of CKILs defined in stby\_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
4. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
5. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
6. CCM will request GPC to restore Arm power by GPC\_PUP\_REQ. If power was removed from the Arm platform, GPC will notify CCM by asserting signal GPC\_PUP\_ACK that power to Arm is back on, and it's safe to exit from STOP mode. Only then will the CCM progress to the next step.
7. After assertion of notification from src that the resets for the power gated modules has been finished, (src\_power\_gating\_reset\_done is set) negate the low power request signals to all modules and enable all module clocks including Arm clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continue to be gated.)

After the system is in run mode, the ccm\_ipg\_stop and system\_in\_stop\_mode signals negate.

## 14.7 CCM Memory Map/Register Definition

### NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at boot time](#) for more information.

## 14.7.1 CCM Control Register (CCM\_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 400F\_C000h base + 0h offset = 400F\_C000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R					0											
W						RBC_EN										
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R				0	COSC_EN			0								
W																
Reset	0	0	0	1	0	0	0	0	0	1	1	1	1	1	1	1

### CCM\_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNTER clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, even if counter is enabled. It is recommended to configure REG_BYPASS_COUNTER as late as possible in the suspend entry sequence.  1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode.  REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core.  000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip

Table continues on the next page...

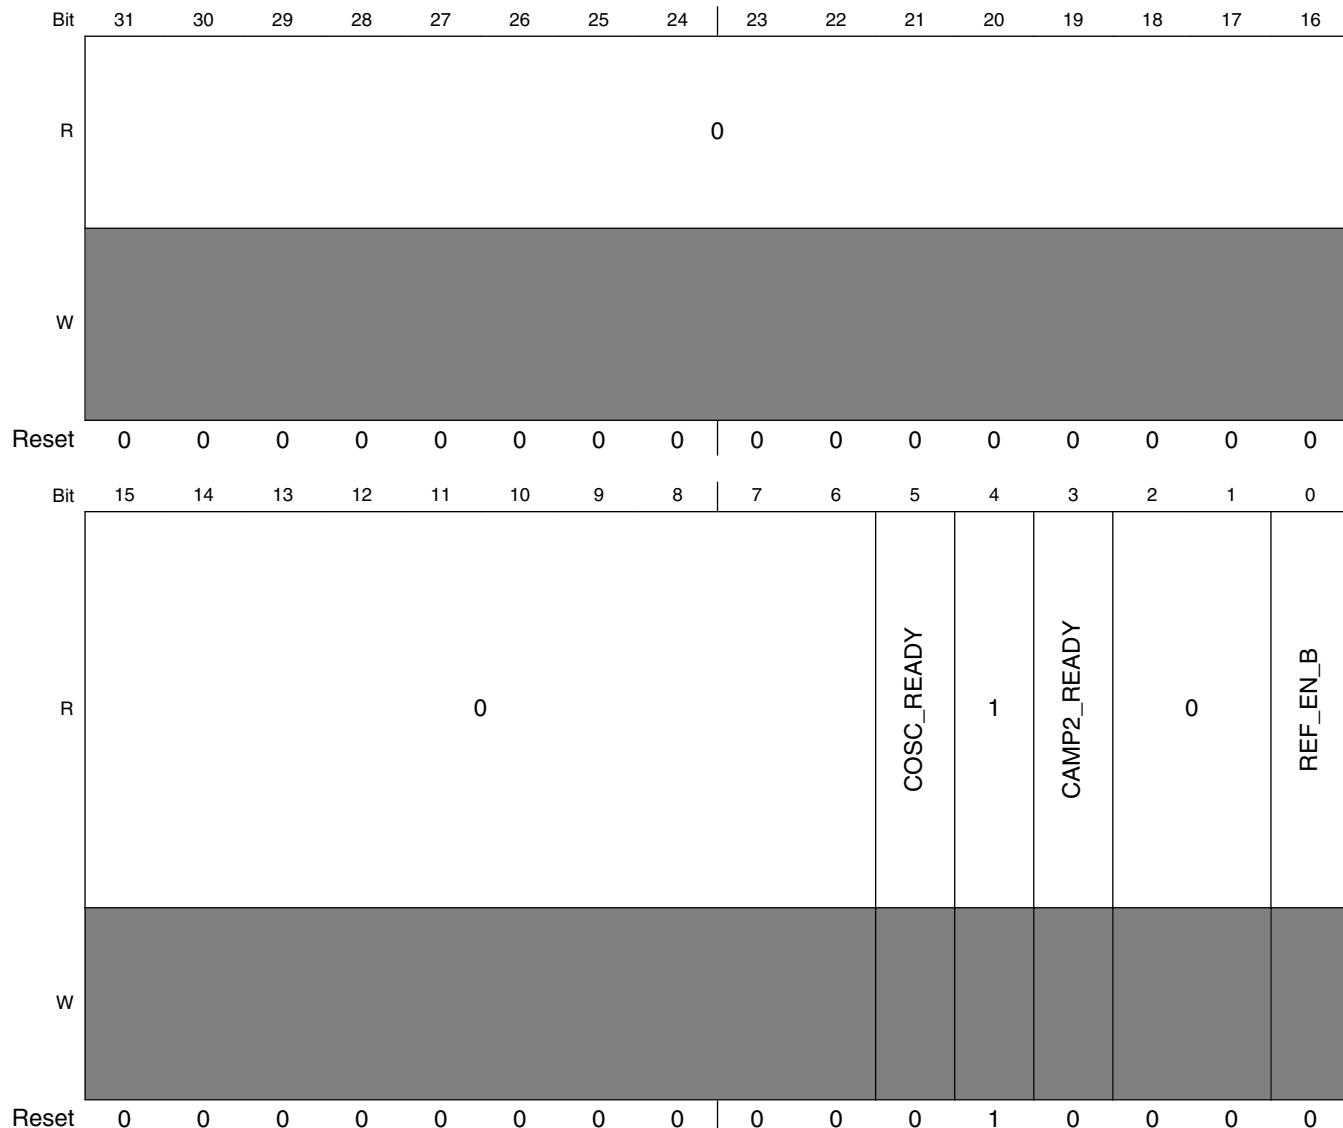

**CCM\_CCR field descriptions (continued)**

Field	Description
	oscillator is ready by an interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source. 0 disable on chip oscillator 1 enable on chip oscillator
11–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpll_ip to use and only then the gate in dpll_ip can be opened. 00000000 count 1 ckil 11111111 count 256 ckil's

## 14.7.2 CCM Status Register (CCM\_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 400F\_C000h base + 8h offset = 400F\_C008h

**CCM\_CSR field descriptions**

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

*Table continues on the next page...*

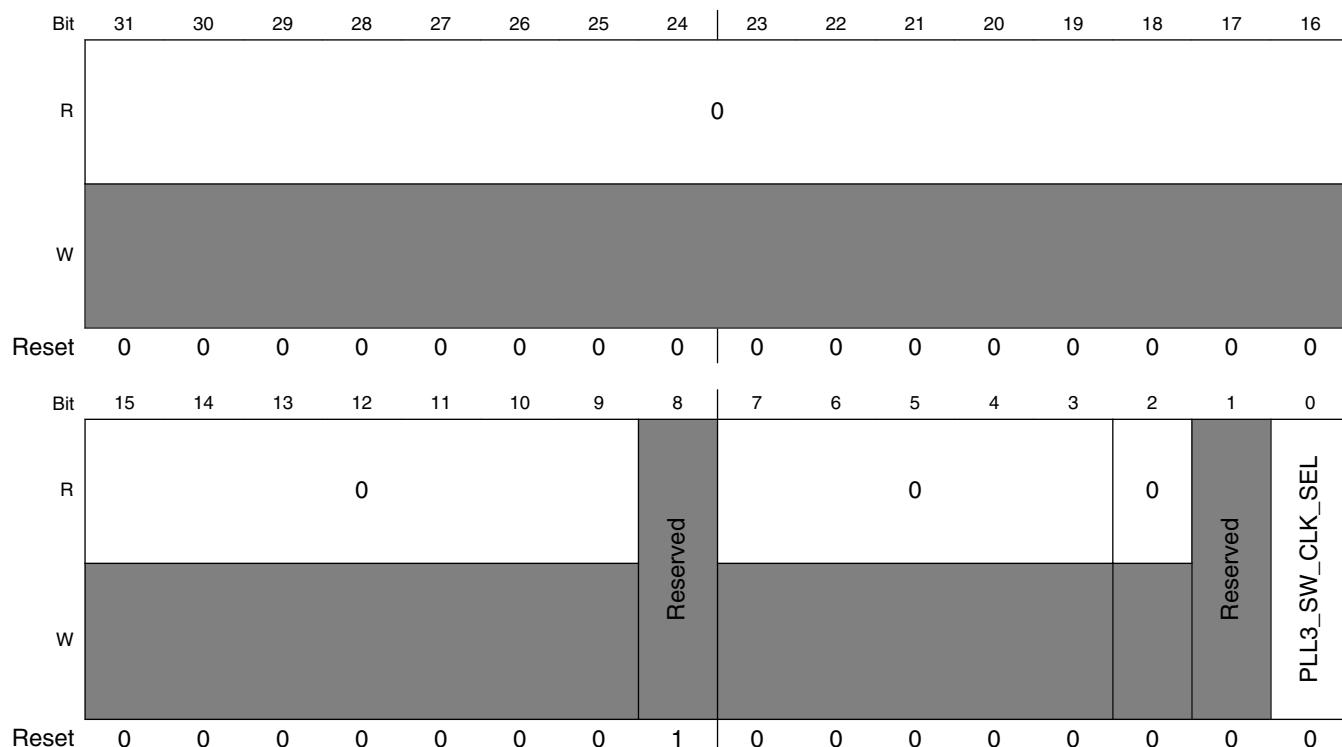

**CCM\_CSR field descriptions (continued)**

Field	Description
5 COSC_READY	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting.  0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3 CAMP2_READY	Status indication of CAMP2.  0 CAMP2 is not ready. 1 CAMP2 is ready.
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm  0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

### 14.7.3 CCM Clock Switcher Register (CCM\_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 400F\_C000h base + Ch offset = 400F\_C00Ch

**CCM\_CCSR field descriptions**

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 -	This field is reserved. Reserved
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 Reserved	This read-only field is reserved and always has the value 0.
1 -	This field is reserved. Reserved

*Table continues on the next page...*

**CCM\_CCSR field descriptions (continued)**

Field	Description
PLL3_SW_CLK_SEL	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

**14.7.4 CCM Arm Clock Root Register (CCM\_CACRR)**

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the Arm clock root generation. The table below provides its field descriptions.

Address: 400F\_C000h base + 10h offset = 400F\_C010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

10–9 CSI_CLK_SEL	Selector for csi_mclk multiplexer 00 derive clock from osc_clk (24M) 01 derive clock from PLL2 PFD2 10 derive clock from pll3_120M 11 derive clock from PLL3 PFD1
-	This field is reserved. Reserved

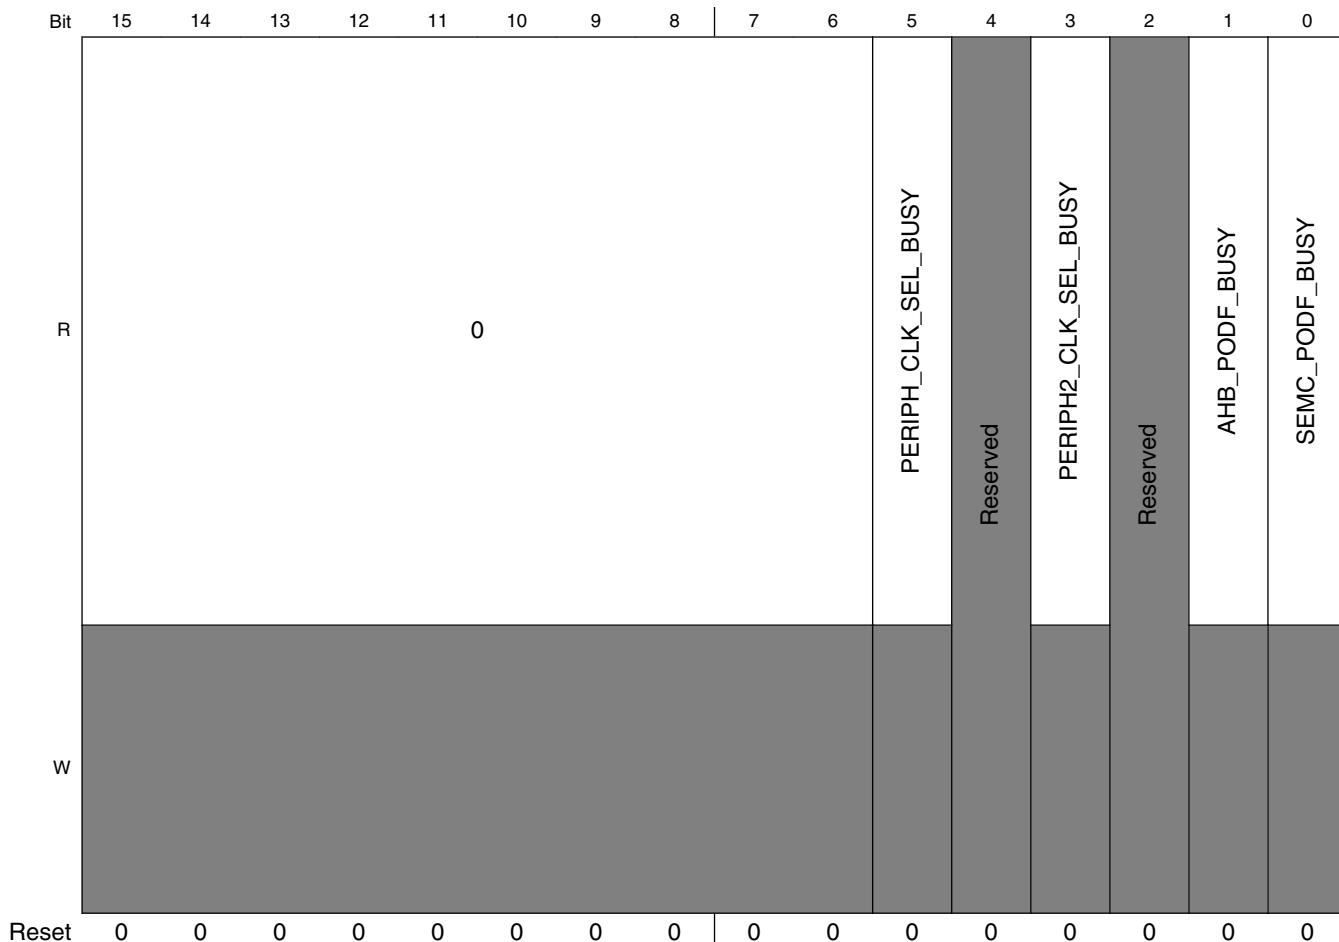

### 14.7.15 CCM Divider Handshake In-Process Register (CCM\_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

Address: 400F\_C000h base + 48h offset = 400F\_C048h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R									0							ARM_PODF_BUSY
W																

Reset 0 0 0 0 0 0 0 | 0 0 0 0 0 0 0 0 0 0

**CCM\_CDHIPR field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 ARM_PODF_ BUSY	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 PERIPH_CLK_ SEL_BUSY	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 -	This field is reserved. Reserved

*Table continues on the next page...*

**CCM\_CDHIPR field descriptions (continued)**

Field	Description
3 PERIPH2_CLK_ SEL_BUSY	Busy indicator for periph2_clk_sel mux control.  0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.
2 -	This field is reserved. Reserved
1 AHB_PODF_ BUSY	Busy indicator for ahb_podf.  0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.
0 SEMC_PODF_ BUSY	Busy indicator for semc_podf.  0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the semc_podf will be applied.

### 14.7.16 CCM Low Power Control Register (CCM\_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation. The table below provides its field descriptions.

Address: 400F\_C000h base + 54h offset = 400F\_C054h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R					0	MASK_L2CC_IDLE	MASK_SCU_IDLE		0	MASK_CORE0_WFI	BYPASS_LPM_HS0	Reserved	BYPASS_LPM_HS1	Reserved		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

W																
Reset	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1

**CCM\_CLPCR field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 MASK_L2CC_IDLE	Mask L2CC IDLE for entering low power mode. <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 MASK_SCU_IDLE	Mask SCU IDLE for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

*Table continues on the next page...*

## CCM\_CLPCR field descriptions (continued)

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 MASK_CORE0_WFI	Mask WFI of core0 for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 BYPASS_LPM_HS0	Bypass low power mode handshake. <b>NOTE:</b> This bit should always be set to 1'b1 by software.
20 -	This field is reserved. Reserved
19 BYPASS_LPM_HS1	Bypass low power mode handshake. <b>NOTE:</b> This bit should always be set to 1'b1 by software.
18–12 -	This field is reserved. Reserved
11 COSC_PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). <b>NOTE:</b> Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode. 0 Voltage will not be changed to standby voltage after next entrance to STOP mode. ( PMIC_STBY_REQ will remain negated - '0' ) 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. ( PMIC_STBY_REQ will be asserted - '1' ).
7 DIS_REF_OSC	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed. The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation. <b>NOTE:</b> When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits.

*Table continues on the next page...*

**CCM\_CLPCR field descriptions (continued)**

Field	Description
	0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'
6 SBYOS	Standby clock oscillator bit. This bit defines if cosc_pwrdown, which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if cosc_pwrdown='1' for the on chip oscillator.  0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and cosc_pwrdown will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and cosc_pwrdown will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after oscnt count, CCM will continue with the exit from the STOP mode process.
5 ARM_CLK_DIS_ON_LPM	Define if Arm clocks (arm_clk, soc_mxclk, soc_pclk, soc_dbg_pclk, vl_wrck) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep Arm clock functioning.  <b>NOTE:</b> Software should not enable Arm power gating in wait mode if this bit is cleared.  0 Arm clock enabled on wait mode. 1 Arm clock disabled on wait mode. .
4–3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of dsm_request signal.  00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved

### 14.7.17 CCM Interrupt Status Register (CCM\_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. After an interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

**NOTE**

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

## CCM Memory Map/Register Definition

Address: 400F\_C000h base + 58h offset = 400F\_C058h

**CCM\_CGPR field descriptions**

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the Arm Platform memories with additional control logic based on the Arm WFI signal. Used to keep the Arm Platform memory clocks enabled if an interrupt is pending when entering low power mode.  <b>NOTE:</b> This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry.  0 Disable the clock to the Arm platform memories when entering Low Power Mode 1 Keep the clocks to the Arm platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable.  0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.

*Table continues on the next page...*

**CCM\_CGPR field descriptions (continued)**

Field	Description
15–14 SYS_MEM_DS_CTRL	System memory DS control 00 Disable memory DS mode always 01 Enable memory (outside Arm platform) DS mode when system STOP and PLL are disabled 1x enable memory (outside Arm platform) DS mode when system is in STOP mode
13–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 EFUSE_PROG_SUPPLY_GATE	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programing 0 fuse programing supply voltage is gated off to the efuse module 1 allow fuse programing.
3–2 -	This field is reserved. Reserved
1 -	Reserved. Keep default value set to '1' for proper operation.
0 PMIC_DELAY_SCALER	Defines clock division of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

**14.7.21 CCM Clock Gating Register 0 (CCM\_CCGR0)**

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

## CCM Memory Map/Register Definition

The figure below represents the CCM Clock Gating Register 0 (CCM\_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 400F\_C000h base + 68h offset = 400F\_C068h

Reserved	This read-only field is reserved and always has the value 1.

## 14.8 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

### 14.8.1 Analog ARM PLL control Register (CCM\_ANALOG\_PLL\_ARMn)

The control register provides control for the system PLL.

Address: 400D\_8000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK								-				PLL_SEL			
W													Reserved			BYPASS
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
	BYPASS_CLK_SRC	ENABLE		POWERDOWN					Reserved				DIV_SELECT			
W																
Reset	0	0	1	1	0	0	0	0	0	1	1	0	0	0	1	1

**CCM\_ANALOG\_PLL\_ARMn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved

Table continues on the next page...

**CCM\_ANALOG\_PLL\_ARMn field descriptions (continued)**

Field	Description
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source.  <b>NOTE:</b> Changing the Bypass clock source also changes the PLL reference clock source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * \text{div\_select}/2.0$ .

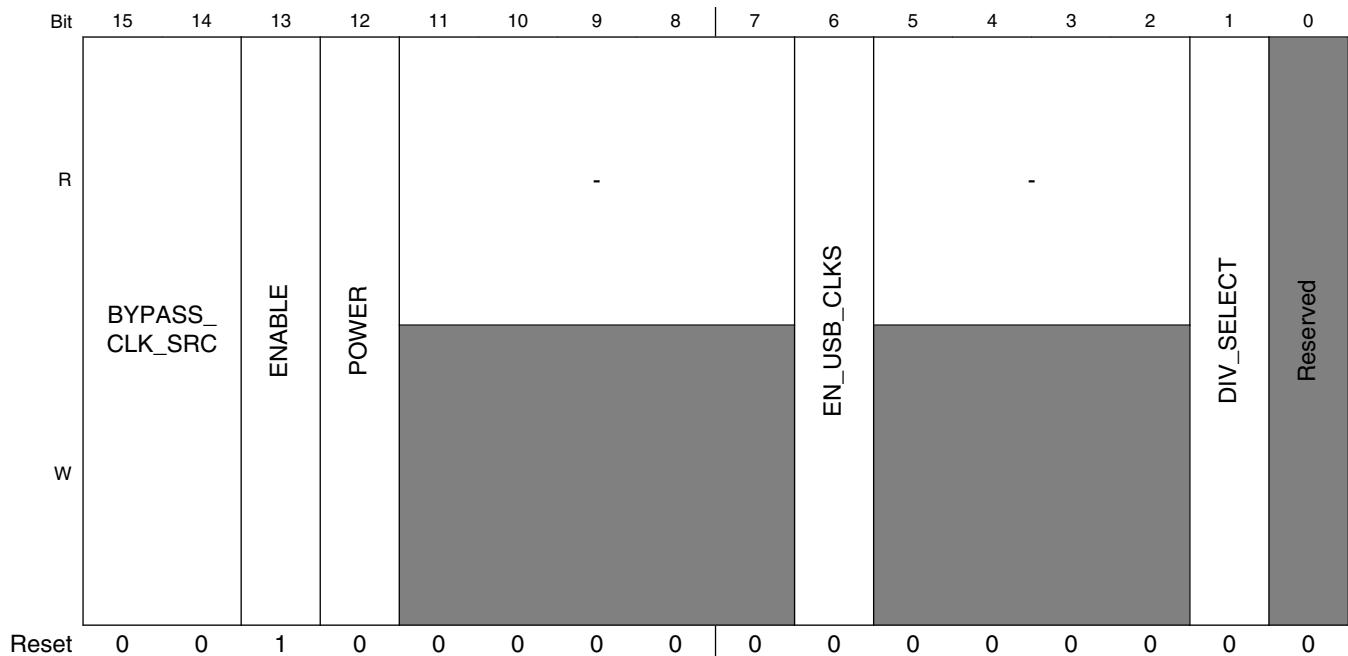

## 14.8.2 Analog USB1 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 400D\_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK								-							
W															BYPASS	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_USB1n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source.
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs. 0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).
1 DIV_SELECT	This field controls the PLL loop divider. 0 - $F_{out}=F_{ref} \times 2^0$ ; 1 - $F_{out}=F_{ref} \times 2^2$ .

Table continues on the next page...

**CCM\_ANALOG\_PLL\_USB1*n* field descriptions (continued)**

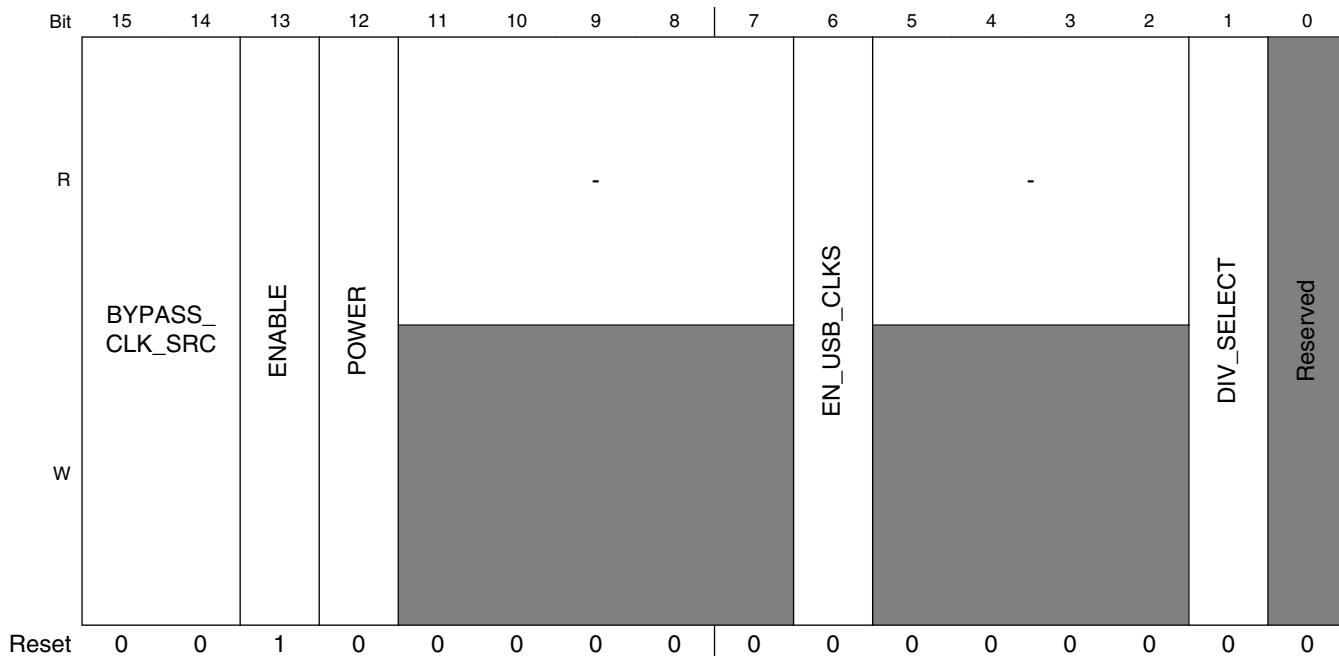

Field	Description
0	This field is reserved.
-	Reserved.

### 14.8.3 Analog USB2 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 400D\_8000h base + 20h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK								-							
W															BYPASS	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**CCM\_ANALOG\_PLL\_USB2n field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
1 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

*Table continues on the next page...*

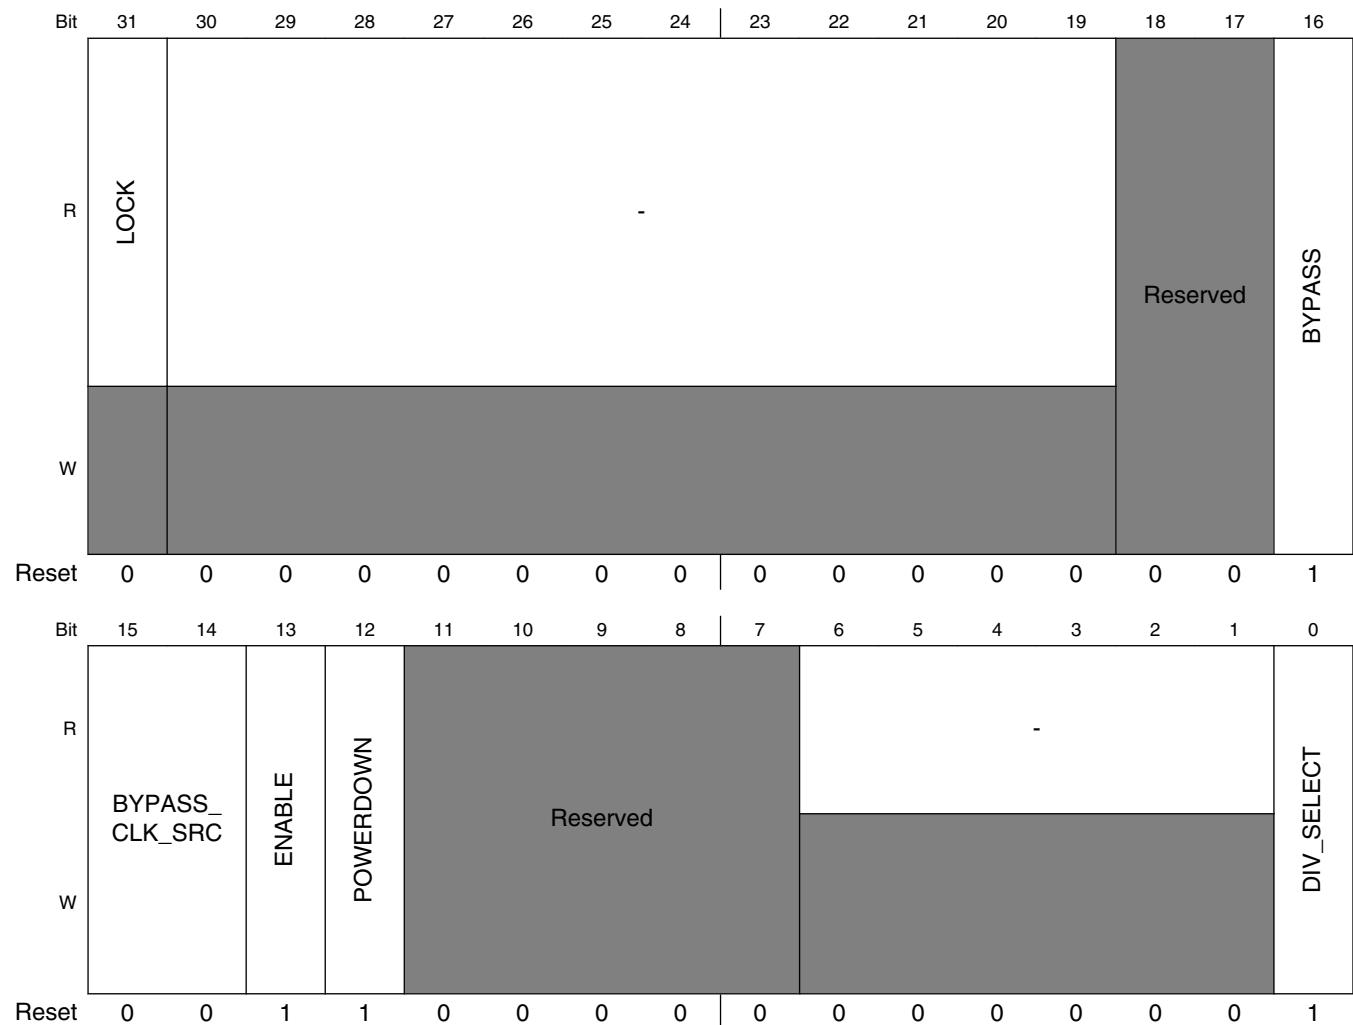

**CCM\_ANALOG\_PLL\_USB2n field descriptions (continued)**

Field	Description
0 -	This field is reserved. Reserved.

#### 14.8.4 Analog System PLL Control Register (CCM\_ANALOG\_PLL\_SYSn)

The control register provides control for the 528MHz PLL.

Address: 400D\_8000h base + 30h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_SYSn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source.
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 14.8.5 528MHz System PLL Spread Spectrum Register (CCM\_ANALOG\_PLL\_SYS\_SS)

This register contains the 528MHz PLL spread spectrum controls.

Address: 400D\_8000h base + 40h offset = 400D\_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ENABLE															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**CCM\_ANALOG\_PLL\_SYS\_SS field descriptions**

Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	Enable bit 0 — Spread spectrum modulation disabled 1 — Spread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

**14.8.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_NUM)**

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator.

Address: 400D\_8000h base + 50h offset = 400D\_8050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	-																A															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**CCM\_ANALOG\_PLL\_SYS\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

### 14.8.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_DENOM)

This register contains the denominator of 528MHz PLL fractional loop divider.

Address: 400D\_8000h base + 60h offset = 400D\_8060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### CCM\_ANALOG\_PLL\_SYS\_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
B	30 bit denominator (B) of fractional loop divider (unsigned integer).

### 14.8.8 Analog Audio PLL control Register (CCM\_ANALOG\_PLL\_AUDIO*n*)

The control register provides control for the audio PLL.

Address: 400D\_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK							-			Reserved	POST_DIV_SELECT	Reserved			BYPASS

W																
Reset	0	0	0	0	1	0	0	0	0	0	0	0	0	1	1	0

**CCM\_ANALOG\_PLL\_AUDIOn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18–17 -	This field is reserved. Revsered
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_AUDIOn field descriptions (continued)**

Field	Description
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

### 14.8.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider (Signed number).

Absolute value should be less than denominator

Address: 400D\_8000h base + 80h offset = 400D\_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CCM\_ANALOG\_PLL\_VIDEOOn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Revserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_VIDEOOn field descriptions (continued)**

Field	Description
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

### 14.8.12 Numerator of Video PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_VIDEO\_NUM)

This register contains the numerator (A) of Video PLL fractional loop divider (signed number).

Absolute value should be less than denominator

Address: 400D\_8000h base + B0h offset = 400D\_80B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CCM\_ANALOG\_PLL\_VIDEO\_DENOM field descriptions**

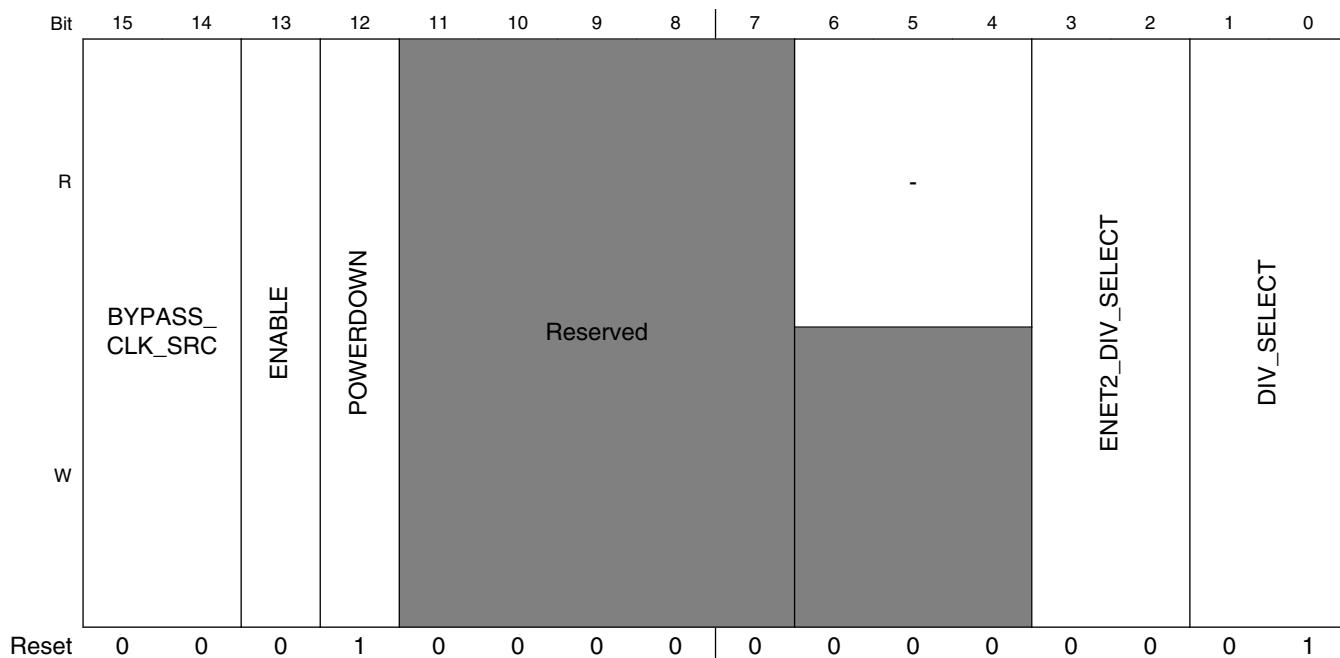

Field	Description
31–30 -	Always set to zero (0).
B	30 bit denominator of fractional loop divider.

### 14.8.14 Analog ENET PLL Control Register (CCM\_ANALOG\_PLL\_ENETn)

The control register provides control for the ENET PLL.

Address: 400D\_8000h base + E0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	LOCK							-				ENET_25M_REF_EN	ENET2_REF_EN	Reserved	Reserved	BYPASS
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

**CCM\_ANALOG\_PLL\_ENETn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 ENET_25M_REF_EN	Enable the PLL providing ENET 25 MHz reference clock
20 ENET2_REF_EN	Enable the PLL providing the ENET2 reference clock
19 -	This field is reserved. Reserved
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable the PLL providing the ENET reference clock.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.

Field	Description
6–4 -	Always set to zero (0).
3–2 ENET2_DIV_SELECT	Controls the frequency of the ENET2 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz
DIV_SELECT	Controls the frequency of the ethernet reference clock.00 - 25MHz; 01 - 50MHz; 10 - 100MHz (not 50% duty cycle); 11 - 125MHz;

### 14.8.15 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_480n)

The PFD\_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 400D\_8000h base + F0h offset + (4d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

PFD1\_FRAC

PFD0\_FRAC

**CCM\_ANALOG\_PFD\_480n field descriptions**

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 * 18 / \text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 * 18 / \text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

## CCM ANALOG PFD 480*n* field descriptions (continued)

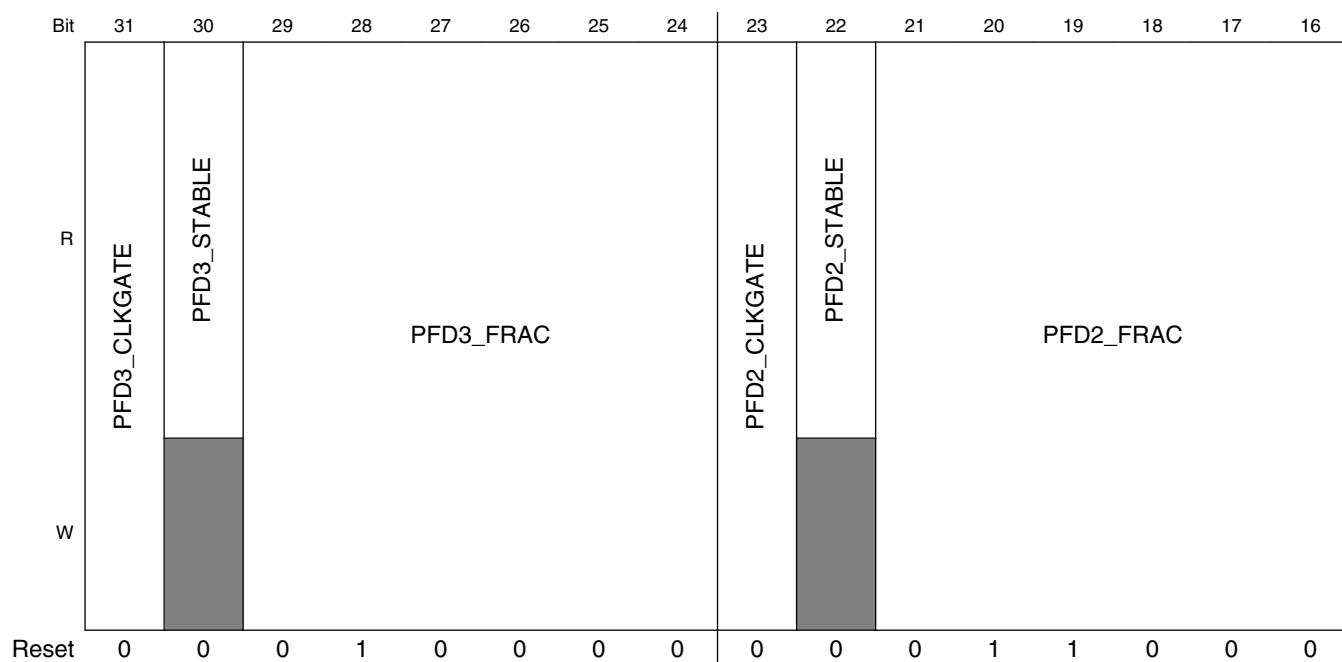

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480*18/\text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480*18/\text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

### **14.8.16 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_528n)**

The PFD\_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

Address: 400D\_8000h base + 100h offset + (4d × i), where i=0d to 3d

### CCM\_ANALOG\_MISC0n field descriptions

Field	Description
31 -	This field is reserved.
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true. <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>
29 RTC_XTAL_SOURCE	This field indicates which chip source is being used for the rtc clock. <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a> 0 Internal ring oscillator 1 RTC_XTAL
28-26 CLKGATE_DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify. <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a> 000 0.5ms

Table continues on the next page...

## CCM\_ANALOG\_MISC0n field descriptions (continued)

Field	Description
	<p>001 1.0ms      010 2.0ms      011 3.0ms      100 4.0ms      101 5.0ms      110 6.0ms      111 7.0ms</p>
25 CLKGATE_CTRL	<p>This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block.</p> <p><b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p> <p>0 <b>ALLOW_AUTO_GATE</b> — Allow the logic to automatically gate the clock when the XTAL is powered down.      1 <b>NO_AUTO_GATE</b> — Prevent the logic from ever gating off the clock.</p>
24–17 -	<p>This field is reserved.      Always set to zero.</p>
16 OSC_XTALOK_EN	<p>This bit enables the detector that signals when the 24MHz crystal oscillator is stable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p>
15 OSC_XTALOK	<p>Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p>
14–13 OSC_I	<p>This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a></p> <p>00 <b>NOMINAL</b> — Nominal      01 <b>MINUS_12_5_PERCENT</b> — Decrease current by 12.5%      10 <b>MINUS_25_PERCENT</b> — Decrease current by 25.0%      11 <b>MINUS_37_5_PERCENT</b> — Decrease current by 37.5%</p>
12 DISCON_HIGH_SNVS	<p>This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.</p> <p>0 Turn on the switch      1 Turn off the switch</p>
11–10 STOP_MODE_CONFIG	<p>Configure the analog behavior in stop mode.</p> <p>00 All analog except RTC powered down on stop mode assertion.      01 Beside RTC, analog bandgap, 1p1 and 2p5 regulators are also on.      10 Beside RTC, 1p1 and 2p5 regulators are also on, low-power bandgap is selected so that the normal analog bandgap together with the rest analog is powered down.      11 Beside RTC, low-power bandgap is selected and the rest analog is powered down.</p>

*Table continues on the next page...*

**CCM\_ANALOG\_MISC0n field descriptions (continued)**

Field	Description
9–8 -	This field is reserved. Reserved
7 REFTOP_ VBGUP	Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
6–4 REFTOP_ VBGADJ	<b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>  000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%
3 REFTOP_ SELFBIASOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.  <b>NOTE:</b> Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>  0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.
2–1 -	This field is reserved.
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry.  <b>NOTE:</b> A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>

#### 14.8.18 Miscellaneous Register 1 (CCM\_ANALOG\_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks. The LVDS1 and LVDS2 controls below control the behavior of the anaclk1/1b LVDS IO.

Address: 400D\_8000h base + 160h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_MISC1n field descriptions**

Field	Description
31 IRQ_DIG_BO	This status bit is set to one when any of the digital regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
30 IRQ_ANA_BO	This status bit is set to one when any of the analog regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted.  <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
29 IRQ_TEMPHIGH	This status bit is set to one when the temperature sensor high interrupt asserts for high temperature.  <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
28 IRQ_TEMPLOW	This status bit is set to one when the temperature sensor low interrupt asserts for low temperature.  <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
27 IRQ_TEMPPANIC	This status bit is set to one when the temperature sensor panic interrupt asserts for a panic high temperature.  <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
26–18 -	This field is reserved. Reserved
17 PFD_528_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_528 clocks anytime the PLL_528 is unlocked or powered off.
16 PFD_480_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_480 clocks anytime the USB1_PLL_480 is unlocked or powered off.
15–14 -	This field is reserved. Reserved
13 -	This field is reserved. Reserved
12 LVDSCLK1_ IBEN	This enables the LVDS input buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
11 -	This field is reserved. Reserved
10 LVDSCLK1_ OBEN	This enables the LVDS output buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
9–5 -	This field is reserved. Reserved
LVDS1_CLK_ SEL	This field selects the clk to be routed to anaclk1/1b.  00000 <b>ARM_PLL</b> — Arm PLL 00001 <b>SYS_PLL</b> — System PLL 00010 <b>PF4</b> — ref_pfd4_clk == pll2_pfd0_clk

### 15.2 Overview

This block comprises both the 24 MHz and 32 kHz implementation of a biased amplifier that when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator.

The block includes means to:

- Accept an external clock source.
- Detect if the crystal frequency is close to 24 MHz or 32 kHz.
- Reduce the operating current via software after the oscillator has started (24 MHz specific feature)
- Supply another ~32 kHz clock source based off an independent internal oscillator if there is no oscillation sensed on the RTC\_XTAL bumps(contacts) (32 kHz specific

## External Signals

- feature). The internal oscillator will provide clocks to the same on-chip modules as the external 32 kHz oscillator.
- Automatically switch to the external oscillation source when sensed on the RTC\_XTAL bumps(contact) (32 kHz specific feature).

## 15.3 External Signals

The table found here describes the external signals of XTALOSC:

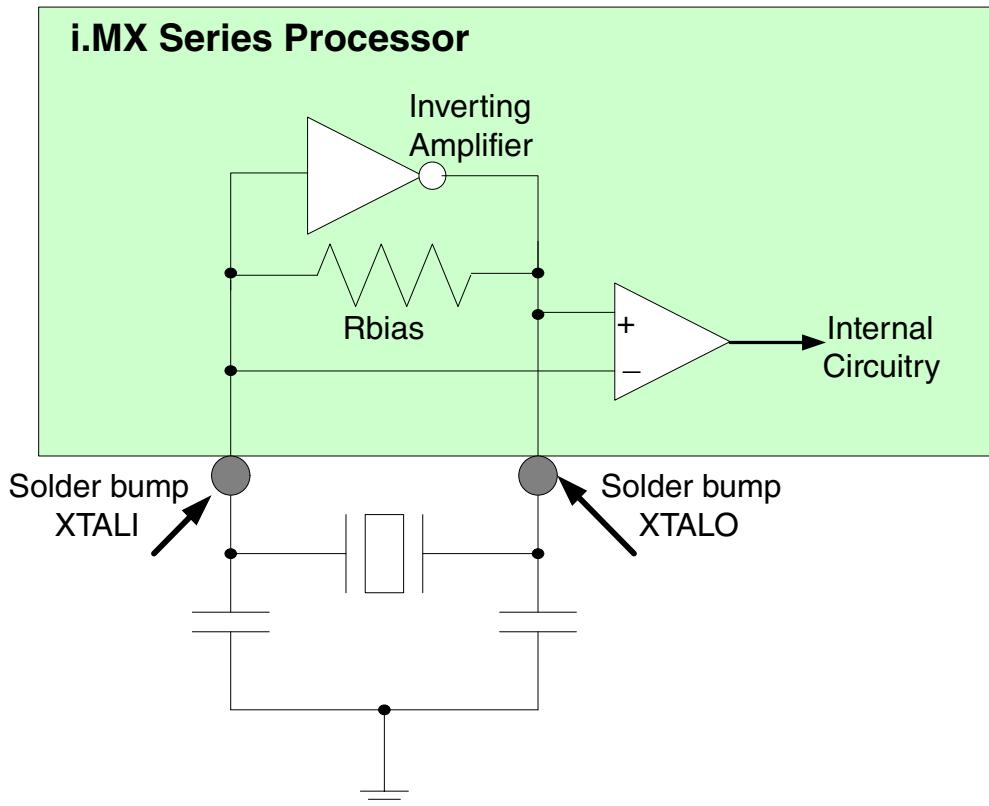

**Table 15-2. XTALOSC External Signals**

Signal	Description	Pad	Mode	Direction
REF_CLK_32K	32 kHz reference clock	GPIO_AD_B0_00	ALT2	O
REF_CLK_24M	24 MHz reference clock	GPIO_AD_B0_01	ALT2	O
		GPIO_AD_B0_03 pin 0	ALT6	
		GPIO_AD_B0_13 pin 25	ALT7	
XTALI	Crystal oscillator input signal	XTALI	No Muxing	O
XTALO	Crystal oscillator output signal	XTALO	No Muxing	O

## 15.4 Crystal Oscillator 24 MHz

### 15.4.1 Oscillator Configuration (24 MHz)

The basic block diagram of the 24 MHz module configured as a crystal oscillator is shown below.

**Figure 15-1. Oscillator Configuration (24 MHz)**

This integrated biased amplifier can be used to create different frequency oscillators with different external component selection. However, care should be taken as many of the serial IO modules depend on the fixed frequency of 24 MHz. Please consult the sections of the document pertaining to the USB, ENET interfaces, for example. After a healthy oscillation is established, then the bias current of the oscillator can generally be reduced to save power. This is accomplished through the XTALOSC24M\_MISC0[OSC\_I] bits, defined in the MISC0 register later in this chapter. Restore the XTALOSC24M\_MISC0[OSC\_I] bits before going into a power mode where the XTALOSC24 is powered down or oscillator startup may become an issue. The power down of the XTALOSC24 module is controlled by the CCM. See this section of the manual for more details.

## 15.4.2 Bypass Configuration (24 MHz)

If it is desired to drive the chip with an external clock source, then the 24 MHz oscillator could be driven in one of three configurations using a nominal 1.1V source.

1. A single ended external clock source can be used to overdrive the output of the amplifier (XTALO). Since the oscillation sensing amplifier is differential, the

XTALI pin should be externally floating and capacitively loaded. The combination of the internal biasing resistor and the external capacitor will filter the signal applied to the XTALO pin and develop a rough reference for the sensing amplifier to compare to.

2. A single ended external clock source can be used to drive XTALI. In this configuration, XTALO should be left externally floating.
3. A differential external clock source can be used to drive both XTALI and XTALO.

Generally, configuration 2 is anticipated to be the most used configuration, but all three configurations may be utilized.

### 15.4.3 RC Oscillator (24 MHz)

A lower-power RC oscillator module is available on-chip as a possible alternative to the 24 MHz crystal oscillator after a successful power-up sequence.

The 24 MHz RC oscillator is a self-tuning circuit that will output the programmed frequency value by using the RTC clock as its reference. This oscillator is intended for normal operation and not fast boot.

While the power consumption of this RC oscillator is much lower than the 24 MHz crystal oscillator, one limitation of this RC oscillator module is that its clock frequency is not as accurate. Therefore, care should be observed when using this oscillator as the reference for the on-chip PLLs as their output clock frequency will be lower/higher than when using the 24 MHz crystal oscillator clock.

### 15.4.4 Crystal Frequency Detection(24 MHz)

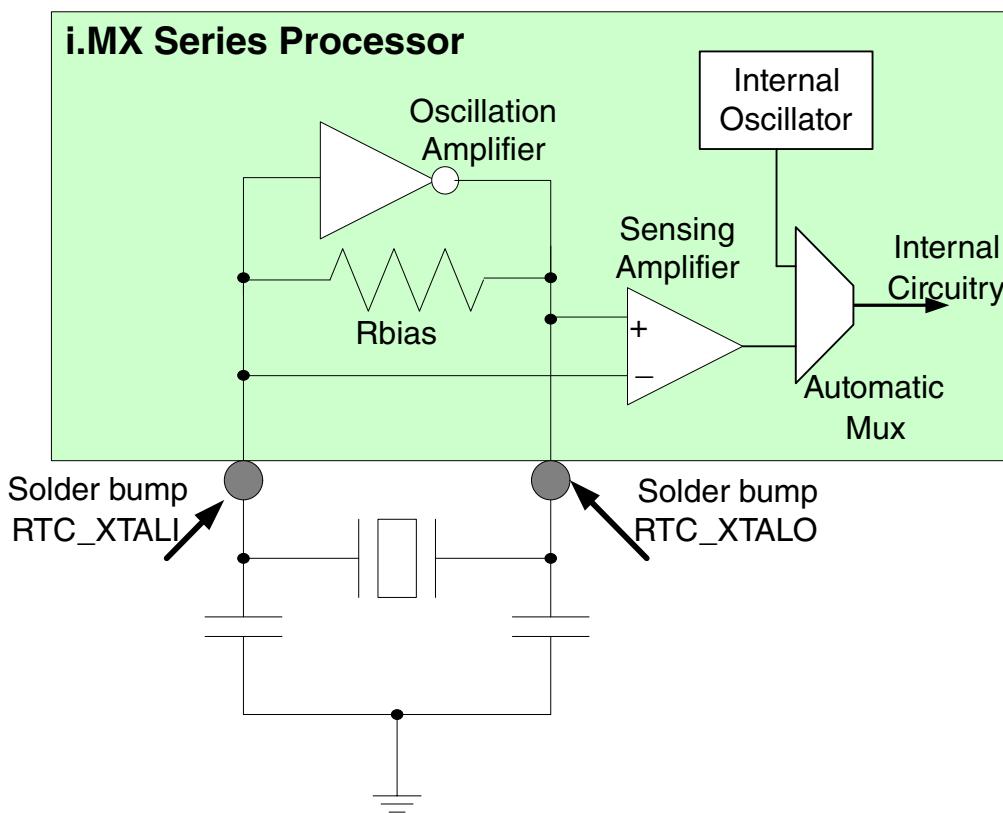

A submodule exists that gives a fairly crude (relative to the accuracy of a crystal) estimation of whether the clock frequency is correct.

This function may be enabled by setting the XTALOSC24M\_MISC0[OSC\_XTALOK\_EN] bit. It is disabled at system reset. When the oscillator is stable and the correct frequency is detected, the XTALOSC24M\_MISC0[OSC\_XTALOK] bit will be set. Note that the correct frequency will be observed before the oscillator fully blooms(the oscillation waveform build-up is completed).

## 15.5 Crystal Oscillator 32 kHz

### 15.5.1 Oscillator Configuration (32 kHz)

The basic block diagram of the 32 kHz module configured as a crystal oscillator is shown below.

**Figure 15-2. Oscillator Configuration (32 kHz)**

This integrated biased amplifier can be used to create different frequency oscillators with different external component selection. Generally, RTC oscillators are either implemented with 32 kHz or 32.768 kHz crystals. Please consult the Security Reference Manual for appropriate frequency selection and configuration. Care must be taken to limit external leakage as this may debias the amplifier and degrade the gain.

The internal oscillator is automatically multiplexed in the clocking system when the system detects a loss of clock. The internal oscillator will provide clocks to the same on-chip modules as the external 32 kHz oscillator. The internal oscillator is not precise relative to a crystal. While it will provide a clock to the system, it generally will not be precise enough for long term time keeping. The internal oscillator is anticipated to be useful for quicker startup times and tampering prevention, but should not be used as the exclusive source for the 32 kHz clocks.

## 15.5.2 Bypass Configuration (32 kHz)

If it is desired to drive the chip with an external clock source, then the 32 kHz oscillator could be driven in one of three configurations using a nominal 1.1V source.

1. A single ended external clock source can be used to overdrive the output of the amplifier (RTC\_XTALO). Since the oscillation sensing amplifier is differential, the RTC\_XTALI pin should be externally floating and capacitively loaded. The combination of the internal biasing resistor and the external capacitor will filter the signal applied to the RTC\_XTALO pin and develop a rough reference for the sensing amplifier to compare to.
2. A single ended external clock source can be used to drive RTC\_XTALI. In this configuration, RTC\_XTALO should be left externally floating.
3. A differential external clock source can be used to drive both RTC\_XTALI and RTC\_XTALO.

Generally, configuration 2 is anticipated to be the most used configuration, but all three configurations may be utilized.

## 15.6 XTALOSC 24MHz Memory Map/Register Definition

### NOTE

The register content is mixed with analog functions not related to the oscillator function. These bits are noted.

**XTALOSC24M memory map**

R																
W																
Reset	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0

**XTALOSC24M\_OSC\_CONFIG0n field descriptions**

Field	Description
31–24 RC_OSC_ PROG_CUR	The current tuning value in use.
23–20 -	Reserved.
19–16 HYST_MINUS	Negative hysteresis value. Subtracted from target value before comparison. This, along with HYST_PLUS creates a range.
15–12 HYST_PLUS	Positive hysteresis value. Added to target value before comparison. This, along with HYST_MINUS creates a range.
11–4 RC_OSC_PROG	RC osc. tuning values.
3 INVERT	Invert the stepping of the calculated RC tuning value.

Table continues on the next page...

**XTALOSC24M\_OSC\_CONFIG0n field descriptions (continued)**

Field	Description
2 BYPASS	Bypasses any calculated RC tuning value and uses the programmed register value.
1 ENABLE	Enables the tuning logic to calculate new RC tuning values. Disabling essentially freezes the state of the calculation.
0 START	Start/stop bit for the RC tuning calculation logic. If stopped the tuning logic is reset.

### 15.6.4 XTAL OSC Configuration 1 Register (XTALOSC24M\_OSC\_CONFIG1n)

This register is used to configure the 24MHz RC oscillator.

Address: 400D\_8000h base + 2B0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	COUNT_RC_CUR												-												COUNT_RC_TRG							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	1	0	1	1	1	0	

**XTALOSC24M\_OSC\_CONFIG1n field descriptions**

Field	Description
31–20 COUNT_RC_CUR	The current tuning value in use.
19–12 -	Reserved
COUNT_RC_TRG	The target count used to tune the RC OSC frequency. Essentially the number of desired RC OSC clock cycles is within one 32kHz clock cycle.

### 15.6.5 XTAL OSC Configuration 2 Register (XTALOSC24M\_OSC\_CONFIG2n)

This register is used to configure the 1MHz clock generated from the 24MHz RC oscillator.

Address: 400D\_8000h base + 2C0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**XTALOSC24M\_OSC\_CONFIG2n field descriptions**

Field	Description
31 CLK_1M_ERR_FL	Flag indicates that the count_1m count wasn't reached within 1 32kHz period. This is intended as feedback to software that the HW_ANADIG_OSC_CONFIG2_COUNT_1M_TRG value is too high for the RC Osc frequency.
30–18 -	Reserved.
17 MUX_1M	Mux the corrected or uncorrected 1MHz clock to the output. 0 - free 1MHz clock; 1 - locked 1MHz clock.

*Table continues on the next page...*

**XTALOSC24M\_OSC\_CONFIG2n field descriptions (continued)**

Field	Description
16 ENABLE_1M	Enable the 1MHz clock output. 0 - disabled; 1 - enabled.
15–12 -	Reserved
COUNT_1M_ TRG	The target count used to tune the 1MHz clock frequency. Essentially the number of desired RC OSC clock cycles used to generate the 1MHz clock is within one 32kHz clock cycle.

## **16.2 Overview**

The power management unit (PMU) is designed to simplify the external power interface. The power system can be split into the input power sources and their characteristics, the integrated power transforming and controlling elements, and the final load interconnection and requirements.

A typical power system uses the PMU is depicted in the following diagram.

**Figure 16-1. Power system overview**

Using four LDO regulators, the number of external supplies is greatly reduced. Not counting the backup coin and USB inputs, the number of external supplies is reduced to two. Missing from this external supply total is the number of necessary external supplies to power the desired memory interface; that number varies depending on the type of external memory selected. Other supplies may also be necessary to supply the voltage to the different I/O power segments if their I/O voltages have to be different from what is provided above.

## 16.3 Analog LDO Regulators

There are two analog regulators described here.

### 16.3.1 LDO 1P1

The LDO\_1P1 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8 V–3.3 V) to produce a nominal 1.1 V output voltage.

The output of the regulator can be programmed in 25 mV steps from 0.8 V to 1.4 V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken.

Current limiting can be enabled by setting the PMU\_REG\_1P1[ENABLE\_ILIMIT] bit to allow for in-rush current requirements during startup if needed. Active pulldown can also be enabled by setting the PMU\_REG\_1P1[ENABLE\_PULLDOWN] bit for systems requiring this feature.

### 16.3.2 LDO 2P5

The LDO\_2P5 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage.

The output of the regulator can be programmed in 25mV steps from 2.0V to 2.75V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps.

Current-limiting can be enabled by setting the REG\_PMU\_2P5[ENABLE\_ILIMIT] bit to allow for in-rush current requirements during start-up if needed. Active-pulldown can also be enabled by setting the REG\_PMU\_2P5[ENABLE\_PULLDOWN] bit for systems requiring this feature.

### 16.3.3 Low Power Operation

The 1.1 V and 2.5 V LDO includes an alternate, self-biased, low-precision, weak regulator which can be enabled for applications needing to keep the 1.1 V and 2.5 V output voltage alive during low-power modes where the main regulator and its associated global bandgap reference module are disabled.

The output of this weak regulator is not programmable and is a function of its input power supply as well as load current. The low-power mode is enabled by setting high the PMU\_REG\_1P1[ENABLE\_WEAK\_LINREG] and PMU\_REG\_2P5[ENABLE\_WEAK\_LINREG] bit of the regulator. It is recommended that the following sequence be followed to enable this mode:

1. Throttle down the 1.1 V / 2.5 V attached load to its low-power maintain state.
2. Disable the main 1.1 V / 2.5 V regulator driver by clearing the PMU\_REG\_1P1[ENABLE\_LINREG] / PMU\_REG\_2P5[ENABLE\_LINREG] bit.
3. Enable the weak 1.1 V / 2.5 V regulator by setting the PMU\_REG\_1P1[ENABLE\_WEAK\_LINREG] / PMU\_REG\_2P5[ENABLE\_WEAK\_LINREG] bit.

To go back to full-power operation, reverse the steps outlined above. Note that the external decoupling cap is supporting the power supply between steps 2 and 3. Therefore step 3 should happen appropriately in time relative to the discharge of the supporting capacitor.

## 16.4 USB LDO Regulator

The USB\_LDO module on the chip implements a programmable linear-regulator function from the USB VBUS voltages (typically 5 V) to produce a nominal 3.0 V output voltage.

The output of the regulator can be programmed in 25 mV steps, from 2.625V to 3.4 V . The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitor of 4.7  $\mu$ F, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken. This regulator has a built-in power mux which allows the user to choose to run the regulator from either VBUS supply when both are present. If only one of the VBUS voltages is present, then the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets.

Upon attachment of VBUS, this regulator starts up in a low-power, self-preservation mode to prevent over-voltage conditions on the chip. It is expected that the user transition to full regulation by enabling the regulator and disabling the in-rush current limits via its control registers. Upon VBUS removal, it is further expected that the regulator controls are returned to their reset state.

## 16.5 SNVS Regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which powers the real time clock and SNVS blocks.

The SNVS\_LDO is a non-programmable linear-regulator function, producing a nominal 1.1V output voltage.

## 16.6 PMU Memory Map/Register Definition

The register definitions that affect the behavior of the digital LDO regulators follow.

### NOTE

Some of the registers are collections of bits that affect multiple components on the chip. Those that are not pertinent to this chapter have comments in the related register bitfields.

If a full description is desired, please consult the full register programming reference in the related block.

### 16.6.1 Regulator 1P1 Register (PMU\_REG\_1P1n)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 400D\_8000h base + 110h offset + (4d × i), where i=0d to 3d

**PMU\_REG\_1P1n field descriptions**

Field	Description
31–20 -	This field is reserved.
19 SELREF_WEAK_LINREG	Selects the source for the reference voltage of the weak 1p1 regulator. 0 Weak-linreg output tracks low-power-bandgap voltage 1 Weak-linreg output tracks VDD_SOC_IN voltage
18 ENABLE_WEAK_LINREG	Enables the weak 1p1 regulator. This regulator can be used when the main 1p1 regulator is disabled, under low-power conditions.
17 OK_VDD1P1	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD1P1	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples. Choices must be in this range: 0x1b >= output_trg >= 0x04  <b>NOTE:</b> There may be reduced chip functionality or reliability at the extremes of the programming range.  0x04 0.8V 0x10 1.1V 0x1b 1.375V
7 -	This field is reserved.

Table continues on the next page...

**PMU\_REG\_1P1n field descriptions (continued)**

Field	Description
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.
3 ENABLE_ PULLDOWN	Control bit to enable the pull-down circuitry in the regulator
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_ LINREG	Control bit to enable the regulator output.

## 16.6.2 Regulator 3P0 Register (PMU\_REG\_3P0n)

This register defines the control and status bits for the 3.0V regulator powered by the host USB VBUS pin.

Address: 400D\_8000h base + 120h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R															OK_VDD3P0	BO_VDD3P0

### PMU\_REG\_3P0n field descriptions

Field	Description
31–18 -	This field is reserved.

Table continues on the next page...

**PMU\_REG\_3P0n field descriptions (continued)**

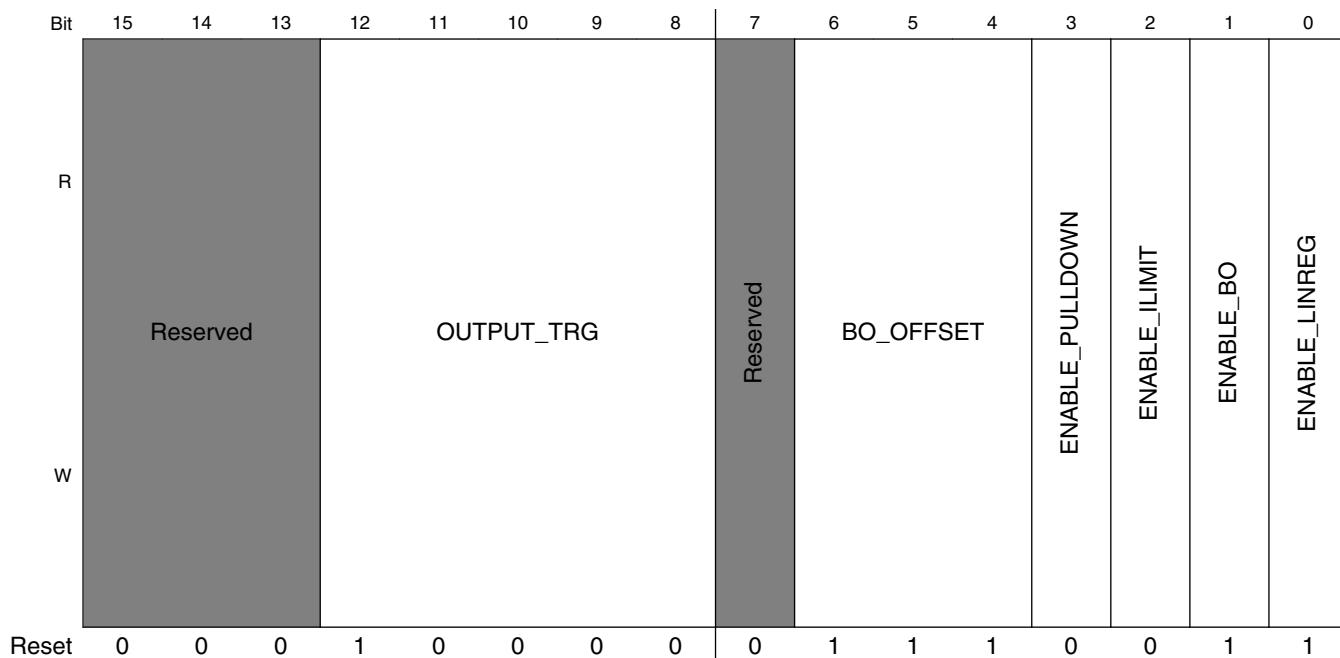

Field	Description
17 OK_VDD3P0	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD3P0	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples.  <b>NOTE:</b> There may be reduced chip functionality or reliability at the extremes of the programming range.  0x00 2.625V 0x0f 3.000V 0x1f 3.400V
7 VBUS_SEL	Select input voltage source for LDO_3P0 from either USB_OTG1_VBUS or USB_OTG2_VBUS. If only one of the two VBUS voltages is present, it is automatically selected.  1 <b>USB_OTG1_VBUS</b> — Utilize VBUS OTG1 power 0 <b>USB_OTG2_VBUS</b> — Utilize VBUS OTG2 power
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may not be relevant because of input supply limitations or load operation.
3 -	Reserved
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output to be set by the programmed target voltage setting and internal bandgap reference.

### 16.6.3 Regulator 2P5 Register (PMU\_REG\_2P5n)

This register defines the control and status bits for the 2.5V regulator.

Address: 400D\_8000h base + 130h offset + (4d × i), where i=0d to 3d

## PMU Memory Map/Register Definition

**PMU\_REG\_2P5n field descriptions**

Field	Description
31–19 -	This field is reserved.
18 ENABLE_WEAK_LINREG	Enables the weak 2p5 regulator. This low power regulator is used when the main 2p5 regulator is disabled to keep the 2.5V output roughly at 2.5V. Scales directly with the value of VDDHIGH_IN.
17 OK_VDD2P5	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD2P5	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples.  <b>NOTE:</b> There may be reduced chip functionality or reliability at the extremes of the programming range.  0x00 2.10V 0x10 2.50V 0x1f 2.875V
7 -	This field is reserved.
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.
3 ENABLE_PULLDOWN	Control bit to enable the pull-down circuitry in the regulator

*Table continues on the next page...*

**PMU\_REG\_2P5n field descriptions (continued)**

Field	Description
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output.

**16.6.4 Digital Regulator Core Register (PMU\_REG\_COREn)**

This register defines the function of the digital regulators

Address: 400D\_8000h base + 140h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### PMU\_MISC0n field descriptions

Field	Description
31 VID_PLL_PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true.
29 RTC_XTAL_SOURCE	This field indicates which chip source is being used for the rtc clock. 0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block.  <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.  <b>NOTE:</b> Not related to PMU.  000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms

Table continues on the next page...

**PMU\_MISC0n field descriptions (continued)**

Field	Description
	101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	<p>This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block.</p> <p><b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.</p> <p><b>NOTE:</b> Not related to PMU.</p> <ul style="list-style-type: none"> <li>0 <b>ALLOW_AUTO_GATE</b> — Allow the logic to automatically gate the clock when the XTAL is powered down.</li> <li>1 <b>NO_AUTO_GATE</b> — Prevent the logic from ever gating off the clock.</li> </ul>
24–17 -	<p>This field is reserved. Always set to zero.</p>
16 OSC_XTALOK_EN	<p>This bit enables the detector that signals when the 24MHz crystal oscillator is stable.</p> <p><b>NOTE:</b> Not related to PMU, Clocking content</p>
15 OSC_XTALOK	<p>Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency.</p> <p><b>NOTE:</b> Not related to PMU, clocking content.</p>
14–13 OSC_I	<p>This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.</p> <p><b>NOTE:</b> Not related to PMU.</p> <ul style="list-style-type: none"> <li>00 <b>NOMINAL</b> — Nominal</li> <li>01 <b>MINUS_12_5_PERCENT</b> — Decrease current by 12.5%</li> <li>10 <b>MINUS_25_PERCENT</b> — Decrease current by 25.0%</li> <li>11 <b>MINUS_37_5_PERCENT</b> — Decrease current by 37.5%</li> </ul>
12 DISCON_HIGH_SNVS	<p>This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.</p> <ul style="list-style-type: none"> <li>0 Turn on the switch</li> <li>1 Turn off the switch</li> </ul>
11–10 STOP_MODE_CONFIG	<p>Configure the analog behavior in stop mode.</p> <ul style="list-style-type: none"> <li>00 <b>SUSPEND (DSM)</b> — All analog except rtc powered down on stop mode assertion.</li> <li>01 <b>STANDBY</b> — Analog regulators are ON.</li> <li>10 <b>STOP (lower power)</b> — Analog regulators are ON.</li> <li>11 <b>STOP (very lower power)</b> — Analog regulators are OFF.</li> </ul>
9–8 -	<p>This field is reserved. Reserved</p>
7 REFTOP_VBGUP	<p>Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.</p>

Table continues on the next page...

**PMU\_MISC0n field descriptions (continued)**

Field	Description
6–4 REFTOP_ VBGADJ	<p>000 Nominal VBG</p> <p>001 VBG+0.78%</p> <p>010 VBG+1.56%</p> <p>011 VBG+2.34%</p> <p>100 VBG-0.78%</p> <p>101 VBG-1.56%</p> <p>110 VBG-2.34%</p> <p>111 VBG-3.12%</p>
3 REFTOP_ SELFBIASOFF	<p>Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.</p> <p><b>NOTE:</b> Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.</p> <p>0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.</p>
2 REFTOP_ LOWPOWER	Control bit to enable the low-power mode in the analog bandgap.
1 REFTOP_ PWDVBGUP	Control bit to power down the VBG-up detection circuitry in the analog bandgap.
0 REFTOP_PWD	<p>Control bit to power-down the analog bandgap reference circuitry.</p> <p><b>NOTE:</b> A note of caution, the bandgap is necessary for correct operation of most of the LDO, pll, and other analog functions on the die.</p>

## 16.6.6 Miscellaneous Register 1 (PMU\_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 400D\_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**PMU\_MISC2n field descriptions**

Field	Description
31–30 VIDEO_DIV	<p>Post-divider for video. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_VIDEOOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.</p> <p><b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.</p> <ul style="list-style-type: none"> <li>00 divide by 1 (Default)</li> <li>01 divide by 2</li> <li>10 divide by 1</li> <li>11 divide by 4</li> </ul>
29–28 REG2_STEP_TIME	<p>Number of clock periods (24MHz clock).</p> <ul style="list-style-type: none"> <li>00 <b>64_CLOCKS</b> — 64</li> <li>01 <b>128_CLOCKS</b> — 128</li> <li>10 <b>256_CLOCKS</b> — 256</li> <li>11 <b>512_CLOCKS</b> — 512</li> </ul>
27–26 REG1_STEP_TIME	<p>Number of clock periods (24MHz clock).</p> <ul style="list-style-type: none"> <li>00 <b>64_CLOCKS</b> — 64</li> <li>01 <b>128_CLOCKS</b> — 128</li> </ul>

Table continues on the next page...

## PMU\_MISC2n field descriptions (continued)

Field	Description
	10 <b>256_CLOCKS</b> — 256 11 <b>512_CLOCKS</b> — 512
25–24 REG0_STEP_TIME	Number of clock periods (24MHz clock).  00 <b>64_CLOCKS</b> — 64 01 <b>128_CLOCKS</b> — 128 10 <b>256_CLOCKS</b> — 256 11 <b>512_CLOCKS</b> — 512
23 AUDIO_DIV_MSB	MSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.  <b>NOTE:</b> MSB bit value pertains to the first bit, please program the LSB bit (bit 15) as well to change divider value  <b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.  00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
22 REG2_OK	Signals that the voltage is above the brownout level for the SOC supply. 1 = regulator output > brownout_target
21 REG2_ENABLE_BO	Enables the brownout detection.
20 -	This field is reserved.
19 REG2_BO_STATUS	Reg2 brownout status bit.
18–16 REG2_BO_OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
15 AUDIO_DIV_LSB	LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIOOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.  <b>NOTE:</b> LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value  <b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.  00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4

*Table continues on the next page...*

**PMU\_MISC2n field descriptions (continued)**

Field	Description
14 -	This field is reserved. Reserved
13 REG1_ENABLE_BO	Enables the brownout detection.
12 -	This field is reserved.
11 REG1_BO_STATUS	Reg1 brownout status bit.  1 Brownout, supply is below target minus brownout offset.
10–8 REG1_BO_OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
7 PLL3_disable	Default value of "0". Should be set to "1" to turn off the USB-PLL(PLL3) in run mode.  <b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.
6 -	This field is reserved.
5 REG0_ENABLE_BO	Enables the brownout detection.
4 -	This field is reserved.
3 REG0_BO_STATUS	Reg0 brownout status bit.  1 Brownout, supply is below target minus brownout offset.
REG0_BO_OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation.  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

### 17.2 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- CPU [Power Gating Control \(PGC\)](#)

Each sub-block has its own IP registers.

GPC determines wake-up IRQ for exiting WAIT/STOP mode (with or without CPU power gating).

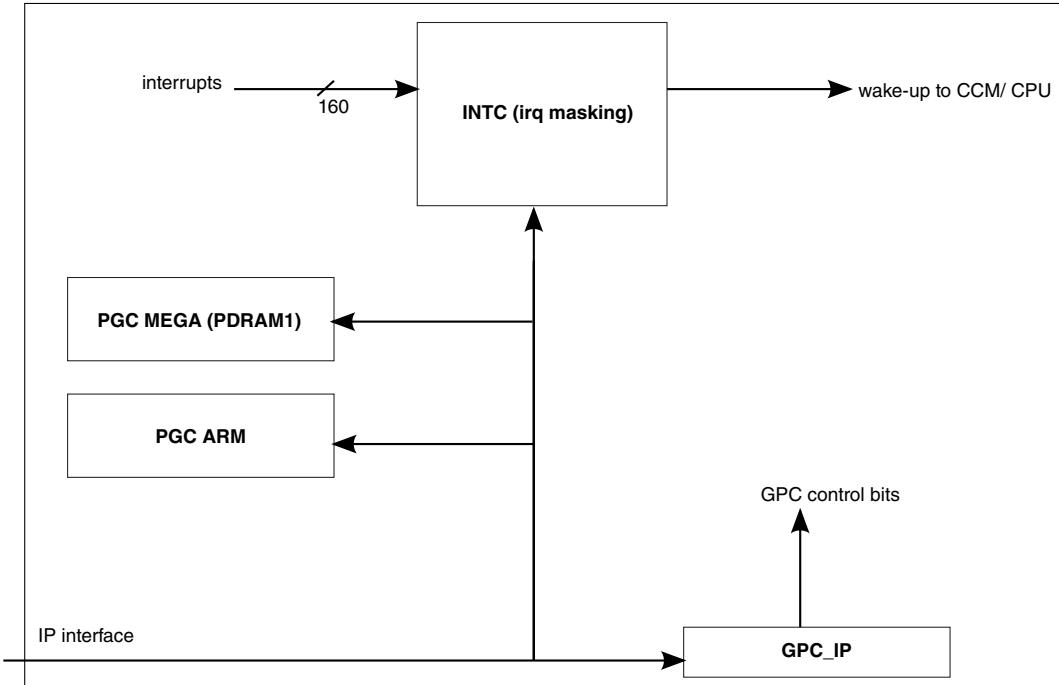

Figure 17-1. GPC Block Diagram

## 17.3 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 17-2. GPC Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

## 17.4 Power Gating Control (PGC)

Power Gating (PGC) is applied to the Arm CPU and FlexRAM optionally in STOP low power mode, after all essential CPU registers data are saved by Arm dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

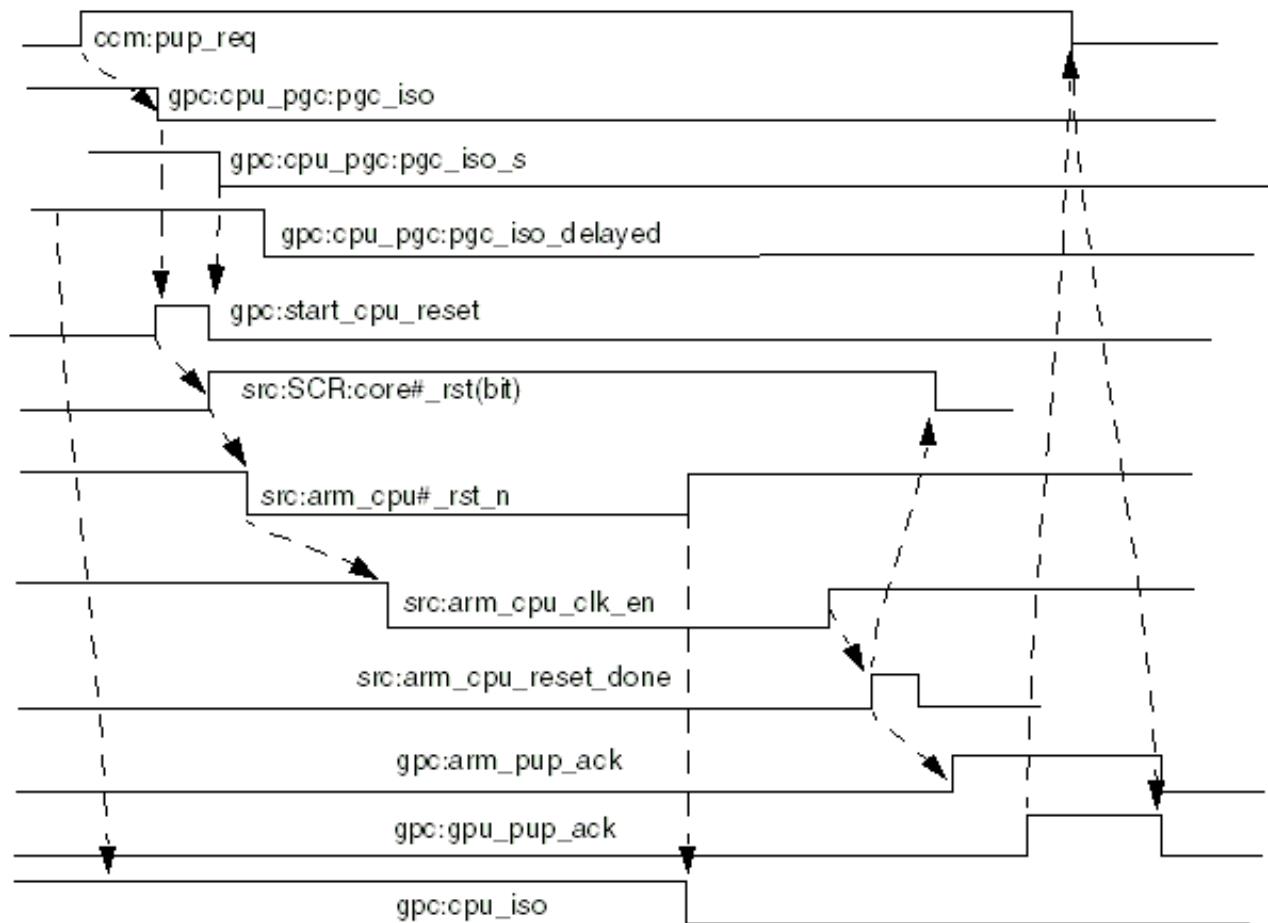

### **PGC power down sequence:**

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (CTRL registers of corresponding PGC module, bit 0).

### **PGC power up sequence:**

- One of the power up irq is asserted.
- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

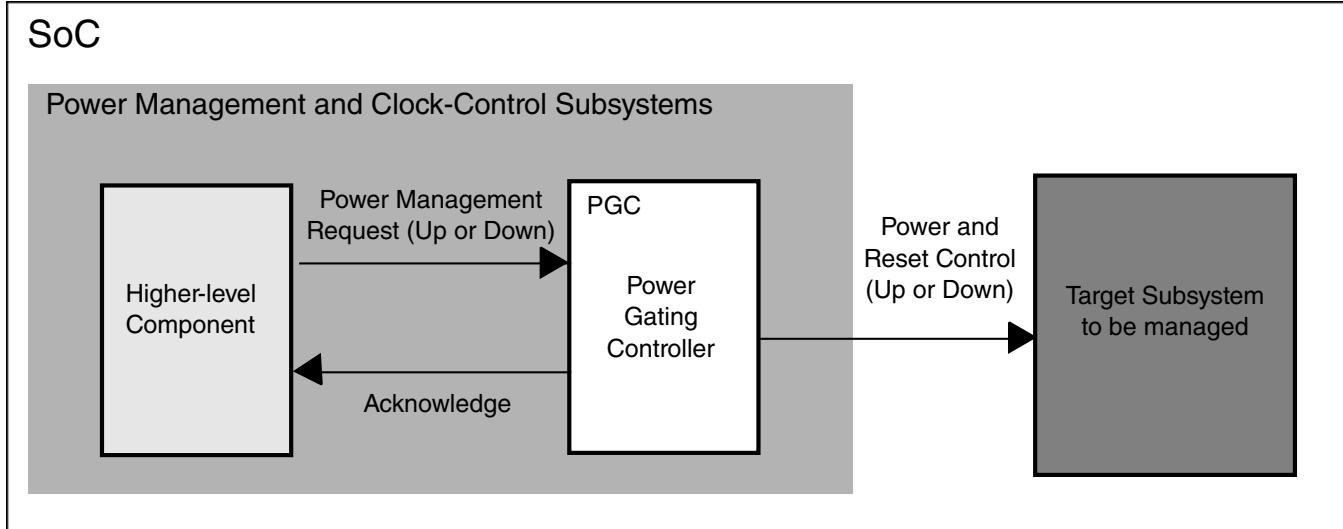

**Figure 17-2. GPC-SRC handshake for reset after power gating**

### 17.4.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 17-3](#) shows PGC as part of the SoC's overall power management scheme.

**Figure 17-3. PGC Block Diagram**

#### 17.4.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

### 17.5 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 160 interrupts.

#### 17.5.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 160 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

## 17.6 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

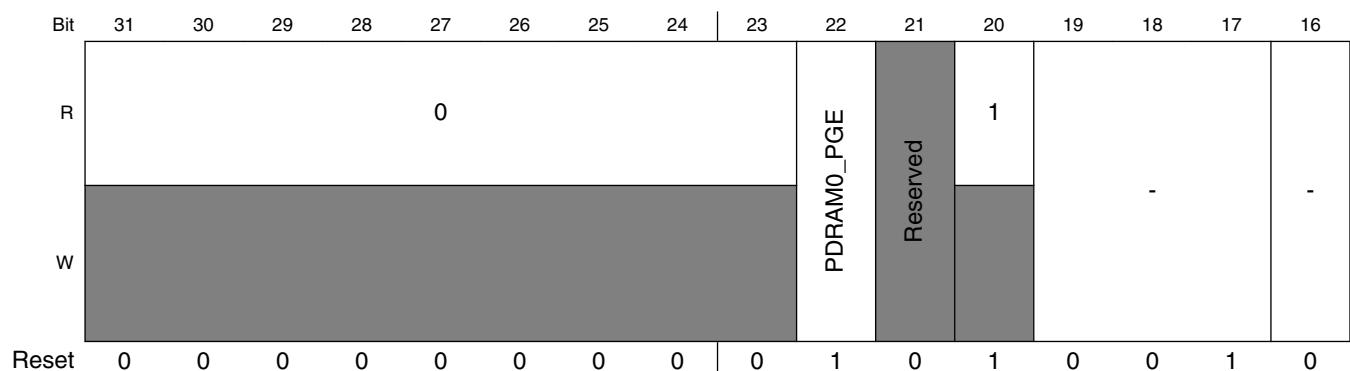

Writes to GPC registers only takes effect in supervisor mode.

**GPC memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
400F_4000	GPC Interface control register (GPC_CNTR)	32	R/W	0052_0000h	<a href="#">17.6.1/1184</a>
400F_4008	IRQ masking register 1 (GPC_IMR1)	32	R/W	0000_0000h	<a href="#">17.6.2/1186</a>

400F_4038	IRQ status resister 5 (GPC_ISR5)	32	R	0000_0000h	<a href="#">17.6.11/1190</a>

### 17.6.1 GPC Interface control register (GPC\_CNTR)

Address: 400F\_4000h base + 0h offset = 400F\_4000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R								0			0	0		MEGA_PUP_REQ		0
W														MEGA_PDN_REQ		0
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**GPC\_CNTR field descriptions**

Field	Description
31–23 Reserved	This read-only field is reserved and always has the value 0.
22 PDRAM0_PGE	FlexRAM PDRAM0 Power Gate Enable 1 FlexRAM PDRAM0 domain will be powered down when the CPU core is powered down.. 0 FlexRAM PDRAM0 domain will keep power even if the CPU core is powered down.
21 -	This field is reserved. Reserved
20 Reserved	This read-only field is reserved and always has the value 1.
19–17 -	Reserved This bitfield is readable/writeable, but avoid writing to this reserved bitfield.
16 -	Reserved This bitfield is readable/writeable, but avoid writing to this reserved bitfield.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 Reserved	This read-only field is reserved and always has the value 0.
4 Reserved	This read-only field is reserved and always has the value 0.
3 MEGA_PUP_REQ	MEGA domain (FlexRAM PDRAM1) power up request. Self-clear bit. <b>Writable but read will always return 0.</b>  <b>NOTE:</b> Software can directly power up FlexRAM PDRAM1 by writing this bit, given PGC_MEGA_CTRL[PCR] is set and FlexRAM PDRAM1 has been powered down by setting MEGA_PDN_REQ. 0 — No Request 1 — Request power up sequence
2 MEGA_PDN_REQ	MEGA domain (FlexRAM PDRAM1) power down request. Self-clear bit. <b>Writable but read will always return 0.</b>  <b>NOTE:</b> Software can directly power down FlexRAM PDRAM1 by writing this bit, given PGC_MEGA_CTRL[PCR] is set.

*Table continues on the next page...*

## GPC CNTR field descriptions (continued)

Field	Description
	0 — No Request 1 — Request power down sequence
Reserved	This read-only field is reserved and always has the value 0.

### 17.6.2 IRQ masking register 1 (GPC\_IMR1)

IMR1 Register - masking of irq[31:0].

Address: 400E 4000h base + 8h offset = 400E 4008h

## GPC IMR1 field descriptions

Field	Description
IMR1	IRQ[31:0] masking bits: 1-irq masked, 0-irq is not masked

### 17.6.3 IRQ masking register 2 (GPC\_IMR2)

IMR2 Register - masking of irq[63:32].

Address: 400E 4000h base + Ch offset = 400E 400Ch

## GPC IMR2 field descriptions

Field	Description
IMR2	IRQ[63:32] masking bits: 1-irq masked, 0-irq is not masked

## 17.6.4 IRQ masking register 3 (GPC\_IMR3)

IMR3 Register - masking of irq[95:64].

Address: 400F\_4000h base + 10h offset = 400F\_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R

#### GPC\_ISR5 field descriptions

Field	Description
ISR5	IRQ[159:128] status, read only

## 17.7 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

### NOTE

PGC MEGA is used to control the power gate of PDRAM1 domain . PGC CPU is used to control the power gate of PDM7 domain (CM7 CPU). FlexRAM PDRAM0 domain is further controlled by GPC\_CNTR[PDRAM0\_PGE] bit.

### PGC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
400F_4220	PGC Mega Control Register (PGC_MEGA_CTRL)	32	R/W	0000_0000h	<a href="#">17.7.1/1192</a>

R								0								
W																PSR
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### PGC\_MEGA\_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one (isolation or power off occurs). Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down.  0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

### 17.7.5 PGC CPU Control Register (PGC\_CPU\_CTRL)

The PGCR enables the response to a power-down request.

Address: 400F\_4000h base + 2A0h offset = 400F\_42A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## DCDC Converter (DCDC)

### 18.1 Chip-specific DCDC information

Table 18-1. Reference links to related information

Topic	Related module(s)	Reference
System memory map	-	<a href="#">System Memory Map</a>
Clocking	CCM	<a href="#">Clock Management</a> <a href="#">Clock Control Module (CCM)</a>
Power management	PMU	<a href="#">Power Management</a> <a href="#">Power Management Unit</a>
Signal multiplexing	IOMUX	<a href="#">External Signals and Pin Multiplexing</a> <a href="#">IOMUX</a>
Interrupts, DMA Events and XBAR Assignments	-	<a href="#">Interrupts, DMA Events and XBAR Assignments</a>

#### NOTE

It is recommended to use the internal DCDC as core supply for cost solution.

#### NOTE

When DCDC bypass mode is used, PSWITCH pin should always be tied to low. No inductor is needed, just keep DCDC\_LP pin floating. DCDC\_IN still needs to be powered, but it can be short with VDDsoc, not necessarily to 3.3 V.

#### NOTE

If DCDC bypass mode is used, it is not recommended to switch back to the internal DCDC enable mode, because the board design is different for DCDC bypass mode and internal DCDC enable mode.

**NOTE**

Discontinuous conduction mode can increase the efficiency of DCDC significantly in case of light current loading, so it is generally recommended. But transient performance is a little worse than continuous mode when the current loading has big increasement suddenly, where the output might has 130 mV ripple.

## 18.2 Overview

This module is a synchronous buck mode DCDC converter with a single output.

### 18.2.1 Block diagram

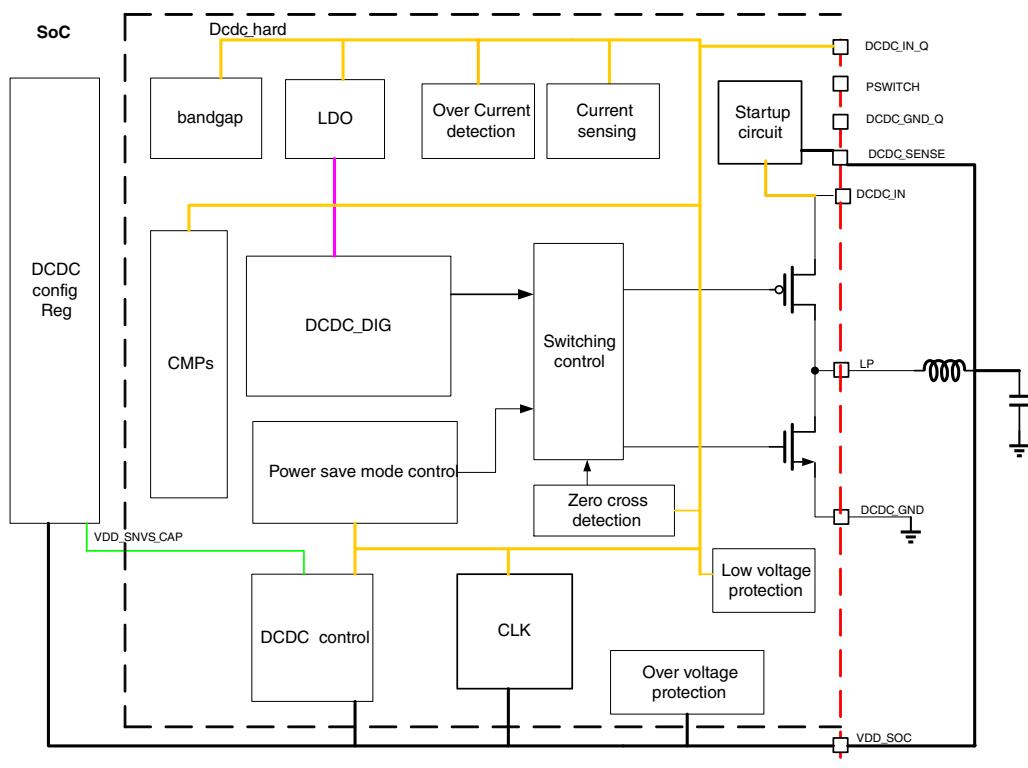

Figure 18-1. DCDC block diagram

### 18.2.2 Features

The DCDC module includes the following features:

- Buck mode, a single output
- PSWITCH pin to control DCDC to enable or bypass DCDC
- Continuous conduction mode (CCM) and discontinuous conduction mode (DCM) operation
- Power-save mode operation
- Over current protection
- Over voltage protection
- Low voltage detection
- Internal oscillator to support the case when the crystal oscillator is not present as in the block diagram

## 18.3 Functional description

The DCDC converter is a synchronous step down converter with a single output. In run mode, it can operate in the continuous conduction mode or discontinuous conduction mode, depending on the level of the load current. The load current level is about 50mA in a typical case, but it depends on the exact value of inductance, input voltage level and output target. If DCM mode is enabled, the DCDC can switch to DCM mode automatically if the current of the inductance goes to zero. The current does not need to be monitored to switch modes. Discontinuous conduction mode must be enabled by the register configuration.

The DCDC can also be configured to operate in power-save mode when the load current is less than 50 mA. During the power-save mode, the converter operates with reduced switching frequency in PFM mode and with a minimum quiescent current to maintain high efficiency.

DCM and CCM both work in run mode, in which the DCDC regulates the output continuously.

PFM is Pulse Frequency Modulation. In PFM, which is also named Pulse Mode, the DCDC is idle until the output drops to the low threshold. The DCDC then starts to charge the output to the high threshold. After it reaches the high threshold, the DCDC is idle again.

The DCDC also includes the following three protection functions:

- Over current protection. In run mode, DCDC will shut down when detecting abnormal large current in the P-type power switch. In power save mode, DCDC will stop charging inductor when detecting large current in the P-type power switch. The threshold is also different in run mode and in power save mode: the former is 1 A–2 A, and the latter is 200 mA–250 mA.

## Application information

- Over voltage protection. DCDC will shut down when detecting the output voltage is too high.
- Low voltage detection. DCDC will shut down when detecting the input voltage is too low.

Another function of DCDC is that it can detect the peak current in the P-channel switch. When the peak current exceeds the threshold, DCDC will give an alert signal, and the threshold can be configured. By this way, DCDC can roughly detect the current loading.

## 18.4 Application information

### 18.4.1 Turn on DCDC

The below conditions must be met to enable the DCDC:

- Power snvs\_1p0 and clk32k in snvs\_1p0 are available
- DCDC\_IN powered up
- After DCDC\_IN powered up, delay about 1ms reset time to enable DCDC
- PSWITCH and PMIC\_ON\_REQ are both high to enable DCDC

The sequence is:

1. Power snvs1p0 and clk32k
2. PMIC\_ON\_REQ = 1
3. DCDC\_IN powered up
4. Delay 1ms reset time
5. PSWITCH = 1
6. DCDC is now enabled

OR:

1. Power snvs\_1p0 and clk32k
2. DCDC\_IN powered up
3. Delay 1ms reset time
4. PSWITCH = 1
5. PMIC\_ON\_REQ = 1
6. DCDC is now enabled

Only if when PSWITCH and PMIC\_ON\_REQ are both high, DCDC can be enabled, PMIC\_ON\_REQ can be before or after DCDC\_IN , just to assure delay about 1ms reset time to enable DCDC after DCDC\_IN power up,

**NOTE**

For safety purpose, over-voltage detector needs to be enabled, i.e. PWD\_HIGH\_VOLT\_DET=1'b0.

### 18.4.2 Target Voltage Adjustment

DISABLE\_STEP=0x0

set TRG

**NOTE**

If setting disable\_step=0, the overshoot will be low when changing the target, but the settling time is longer. If setting disable\_step=1, the settling time is shorter, but the overshoot might be higher. The following settings can speed up the settling time: pwd\_cmp\_offset=0x0; loopctrl\_en\_rcscale=0x4.

### 18.4.3 Continuous Conduction Mode

pwd\_zcd=0x1

pwd\_cmp\_offset=0x0

loopctrl\_en\_rcscale=0x3

### 18.4.4 Discontinuous Conduction Mode

pwd\_zcd=0x0

pwd\_cmp\_offset=0x0

loopctrl\_en\_rcscale=0x4

DCM\_SET\_CTRL=1'b1

**NOTE**

Because discontinuous conduction mode can increase the efficiency of DCDC in case of low current loading, it is always recommended.

## 18.4.5 Power Saving Mode

Before entering this mode, set the target value of run mode the same as power saving mode, because DCDC will switch back to run mode if it detects the current loading is larger than about 50 mA (the threshold can be configured).

PMIC\_STBY\_REQ=0x1

## 18.5 Memory Map and register definition

This section includes the DCDC module memory map and detailed descriptions of all registers.

### 18.5.1 DCDC register descriptions

#### 18.5.1.1 DCDC memory map

DCDC base address: 4008\_0000h

### 18.5.1.2.4 Fields

Field	Function
31 STS_DC_OK	DCDC Output OK This is the status bit indicates if the DCDC output voltage is stable. The lock time depends on the loading and the DCDC mode. 0b - DCDC is settling 1b - DCDC already settled
30 —	Reserved
29	24M XTAL OK

Table continues on the next page...

## Memory Map and register definition

Field	Function
XTAL_24M_OK	This bit determines if the DCDC uses the internal ring oscillator or the xtal 24M. 0b - DCDC uses internal ring OSC 1b - DCDC uses xtal 24M
28 CURRENT_ALE_RT_RESET	Reset Current Alert Signal  This bit is the reset signal of current detector, if current loading is larger than the threshold of the current detector which is set by CUR_SNS_THRS, the current detector will give out an alert signal, CURRENT_ALERT_RESET can reset the alert signal. 0b - Current Alert Signal not reset 1b - Current Alert Signal reset
27 XTALOK_DISABLE	Disable xtalok detection circuit  This is a debug bit which should not be changed in real case. This bit disables and bypasses the clock 24 MHz reference clock detector. 0b - Enable xtalok detection circuit 1b - Disable xtalok detection circuit and always outputs OK signal "1"
26 PWD_CMP_OFFSET	Power down output range comparator  Output range comparator monitors the output voltage of DCDC. When the DCDC output voltage is out of range, this comparator will speed up DCDC control loop in an attempt to bring the DCDC output voltage back in range.  PWD_CMP_OFFSET must be set to 0 (output range comparator on) if LOOPCTRL_EN_RCSCALE is to be used to speed up the transient response. 0b - Output range comparator powered up 1b - Output range comparator powered down
25 —	Reserved
24 —	Reserved
23 —	Reserved
22 —	Reserved
21 LP_HIGH_HYS	Low Power High Hysteric Value  Adjust hysteretic value in low power from 12.5mV to 25mV 0b - Adjust hysteretic value in low power to 12.5mV 1b - Adjust hysteretic value in low power to 25mV
20 LP_OVERLOAD_FREQ_SEL	Low Power Overload Frequency Select  The period of counting the charging times in power save mode 0b - eight 32k cycle 1b - sixteen 32k cycle
19-18 LP_OVERLOAD_THRSH	Low Power Overload Threshold  the threshold of the counting number of charging times during the period that lp_overload_freq_sel sets in power save mode. 00b - 32 01b - 64 10b - 16

Table continues on the next page...

Field	Function
	11b - 8
17 PWD_HIGH_VO LT_DET	<p>Power Down High Voltage Detection</p> <p>Power down overvoltage detection comparator</p> <p>0b - Overvoltage detection comparator is enabled 1b - Overvoltage detection comparator is disabled</p>
16 EN_LP_OVERL OAD_SNS	<p>Low Power Overload Sense Enable</p> <p>Enable the overload detection in power save mode, if current is larger than the overloading threshold (typical value is 50 mA), DCDC will switch to the run mode automatically</p> <p>0b - Overload Detection in power save mode disabled 1b - Overload Detection in power save mode enabled</p>
15-12 —	Reserved
11 PWD_CMP_BA TT_DET	<p>Power Down Battery Detection Comparator</p> <p>Set to "1" to power down the low voltage detection comparator</p> <p>0b - Low voltage detection comparator is enabled 1b - Low voltage detection comparator is disabled</p>
10-9 OVERCUR_TRI G_ADJ	<p>Overcurrent Trigger Adjust</p> <p>The threshold of over current detection in run mode and power save mode:</p> <p>00b - In Run Mode, 1 A. In Power Save Mode, 0.25 A 01b - In Run Mode, 2 A. In Power Save Mode, 0.25 A 10b - In Run Mode, 1 A. In Power Save Mode, 0.2 A 11b - In Run Mode, 2 A. In Power Save Mode, 0.2 A</p>
8 PWD_OVERCU R_DET	<p>Power down overcurrent detection comparator</p> <p>0b - Overcurrent detection comparator is enabled 1b - Overcurrent detection comparator is disabled</p>
7-5 CUR_SNS_THR SH	<p>Current Sense (detector) Threshold</p> <p>Set the threshold of current detector, if the peak current of the inductor exceeds the threshold, the current detector will assert.</p> <p>000b - 150 mA 001b - 250 mA 010b - 350 mA 011b - 450 mA 100b - 550 mA 101b - 650 mA</p>
4 PWD_CUR_SN S_CMP	<p>Power down signal of the current detector.</p> <p>Power down the control signal of the current detector.</p> <p>0b - Current Detector powered up 1b - Current Detector powered down</p>
3 PWD_OSC_INT	<p>Power down internal osc</p> <p>Only set this bit when 24 MHz crystal osc is available</p> <p>0b - Internal oscillator powered up 1b - Internal oscillator powered down</p>
2 SEL_CLK	Select Clock
	Select 24 MHz Crystal clock for DCDC, <b>when DISABLE_AUTO_CLK_SWITCH is set.</b>

*Table continues on the next page...*

## Memory Map and register definition

Field	Function
	If DISABLE_AUTO_CLK_SWITCH is set to 0 and 24M xtal is OK, the clock source will switch from internal ring OSC to 24M xtal automatically. If DISABLE_AUTO_CLK_SWITCH is set to 1, SEL_CLK will determine which clock source the DCDC uses: if SEL_CLK=0, DCDC will use internal ring OSC, if SEL_CLK=1, DCDC will use 24M xtal. 0b - DCDC uses internal ring oscillator 1b - DCDC uses 24M xtal
1 DISABLE_AUTO_CLK_SWITCH	Disable Auto Clock Switch Disable automatic clock switch from internal osc to xtal clock. 0b - If DISABLE_AUTO_CLK_SWITCH is set to 0 and 24M xtal is OK, the clock source will switch from internal ring OSC to 24M xtal automatically 1b - If DISABLE_AUTO_CLK_SWITCH is set to 1, SEL_CLK will determine which clock source the DCDC uses
0 PWD_ZCD	Power Down Zero Cross Detection Power down the zero cross detection function for discontinuous conductor mode. 0b - Zero cross detetion function powered up 1b - Zero cross detetion function powered down

### 18.5.1.3 DCDC Register 1 (REG1)

#### 18.5.1.3.1 Offset

Register	Offset
REG1	4h

### 18.5.1.3.4 Fields

Field	Function
31-29 —	Reserved
28-24 VBG_TRIM	Trim Bandgap Voltage Each bit encoding is 3mV step starting from 0.552V <ul style="list-style-type: none"> <li>• 0x00 = 0.552V</li> <li>• 0x01 = 0.555V</li> <li>• ...</li> <li>• 0x11 = 0.603 V (default value)</li> <li>• ...</li> <li>• 0x1F 0.645 V</li> </ul>
23 LOOPCTRL_EN_HYST	Enable Hysteresis Enable hysteresis in switching converter common mode analog comparators. This feature will improve transient supply ripple and efficiency <p>0b - Disable hysteresis in switching converter common mode analog comparators 1b - Enable hysteresis in switching converter common mode analog comparators</p>
22 —	Reserved
21	Increase Threshold Detection Increase the hysteresis threshold for the common mode analog comparator.

Table continues on the next page...

## Memory Map and register definition

Field	Function
LOOPCTRL_HS_T_THRESH	0b - Lower hysteresis threshold (about 2.5mV in typical, but this value can vary with PVT corners 1b - Higher hysteresis threshold (about 5mV in typical)
20-14 —	Reserved
13-12 LP_CMP_ISRC_SEL	Low Power Comparator Current Bias Set the current bias of low power comparator 00b - 50 nA 01b - 100 nA 10b - 200 nA 11b - 400 nA
11-10 —	Reserved
9 REG_RLOAD_SW	This controls the load resistor of the internal regulator of DCDC. The load resistor is connected by default to 1. To disconnect the load resistor, set this bit to 0.  The internal regulator is only powered on in RUN mode. In SUSPEND mode, the whole internal regulator is powered down.  If REG_RLOAD_SW is set to 1, the DCDC connects a resistor loading on the output of internal regulator when the regulator starts up. This is good for the stability of the regulator startup. Connecting this load resistor increases the current of DCDC_IN by 0.5mA.  After the STS_DC_OK asserts, this control bit can be set to 0 to disconnect the resistor. This saves the current caused by the resistor loading. 0b - Load resistor disconnected 1b - Load resistor connected
8-7 REG_FBK_SEL	Select the feedback point of the internal regulator 00b - The regulator outputs 1.0V with 1.2V reference voltage 01b - The regulator outputs 1.1V with 1.2V reference voltage 10b - The regulator outputs 1.0V with 1.3V reference voltage 11b - The regulator outputs 1.1V with 1.3V reference voltage

### 18.5.1.4.4 Fields

Field	Function
31-29	Reserved
—	
28 DCM_SET_CTRL_L	DCM Set Control Set high to improve the transition from heavy load to light load When DCDC is working in DCM and DCM_SET_CTRL= 1, the DCDC will switch to CCM to discharge the output when the overshoot on the output is higher than the out-of-range threshold, by which the overshoot on the transition can be improved. If DCM_SET_CTRL=0, the DCDC doesn't support this function. DCM_SET_CTRL=1 is recommended when supporting DCM mode.
27 DISABLE_PULSE_SKIP	Disable Pulse Skip Set to "0" : stop charging if the duty cycle is lower than what set by NEGLIMIT_IN. 0b - DCDC will be idle to save current dissipation when the duty cycle get to the low limit which is set by NEGLIMIT_IN.

Table continues on the next page...

## Memory Map and register definition

Field	Function
	1b - DCDC will keep working with the low limited duty cycle NEGLIMIT_IN.
26 —	Reserved
25-16 —	Reserved
15 —	Reserved
14 —	Reserved
13 LOOPCTRL_HY_ST_SIGN	Invert the sign of the hysteresis in DC-DC analog comparators. 0b - Do not invert sign of the hysteresis 1b - Invert sign of the hysteresis
12 LOOPCTRL_RC_SCALE_THRSH	Increase the threshold detection for RC scale circuit. 0b - Do not increase the threshold detection for RC scale circuit. 1b - Increase the threshold detection for RC scale circuit.
11-9 LOOPCTRL_EN_RCSCALE	Enable RC Scale  This enables the analog circuit of the DCDC to respond faster under transient load conditions. A larger number for this bit field means a faster transient response.  In order for a faster transient response to be implemented, the offset comparators must be turned on (PWD_CMP_OFFSET = 0). This means about 80uA additional current consumption is needed.  It is recommended set LOOPCTRL_EN_RCSCALE > 0 if big steps of current loading is required in a real application. LOOPCTRL_EN_RCSCALE = 0x3 is recommended for CCM and LOOPCTRL_EN_RCSCALE = 0x4 for DCM.  However, the DCDC can be more stable with LOOPCTRL_EN_RCSCALE = 0, and the offset comparators are also powered down by default. This results in lower current consumption. If big steps of current loading is not required, it is recommended that the default value of 0 is used.  The value of this bit field doesn't match an RC constant directly.
8-6 LOOPCTRL_DC_FF	Two's complement feed forward step in duty cycle in the switching DC-DC converter. Each time this field makes a transition from 0x0, the loop filter of the DC-DC converter is stepped once by a value proportional to the change. This can be used to force a certain control loop behavior, such as improving response under known heavy load transients.
5-0 —	Reserved

### 19.2 Overview

The temperature sensor module implements a temperature sensor/conversion function based on a temperature-dependent voltage to time conversion.

The module features alarm functions that can raise independent interrupt signals if the temperature is above two high-temperature thresholds and below a low temperature threshold. These temperature thresholds are programmable and designated as low, high and panic temperature. The panic threshold is a special programmable threshold in that if the temperature increases above this value and the temperature-panic-reset interrupt is enabled in the System Reset Controller, the hardware will assume that software no longer has control over the thermal situation and will initiate a reset of the chip.

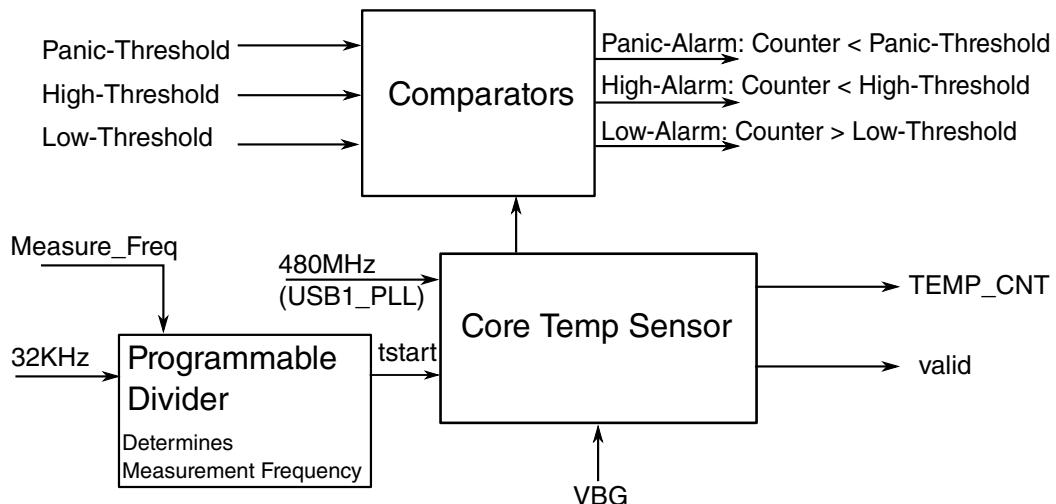

## Overview

In order to avoid false panic temperature initiated resets, the panic alarm will not fire until the temperature panic condition has been met for four consecutive conversion cycles. A self-repeating mode can also be programmed which executes a temperature sensing operation based on a programmed delay.

Since the high and low temperature thresholds are programmable, they form a sliding temperature bracket that can be tailored to the application's needs. For example, at start-up software can set the low temperature threshold to the minimum temperature code and the high temperature threshold to a maximum operating temperature for the system.

The system can then use this module to monitor the on-die temperature and take appropriate actions such as throttling back the core frequency when a the high temperature interrupt is set. After the high temperature interrupt is set then the system can program the low temperature threshold to a desired cool down temperature. The system would then switch to monitoring the low temperature alarm and wait for its interrupt to be set. With this scheme, after the low temperature interrupt is set then software could be assured that the temperature has cooled down to a safe level and the process could be repeated.

The high-level implementation of the temperature sensor is shown in the figure below.

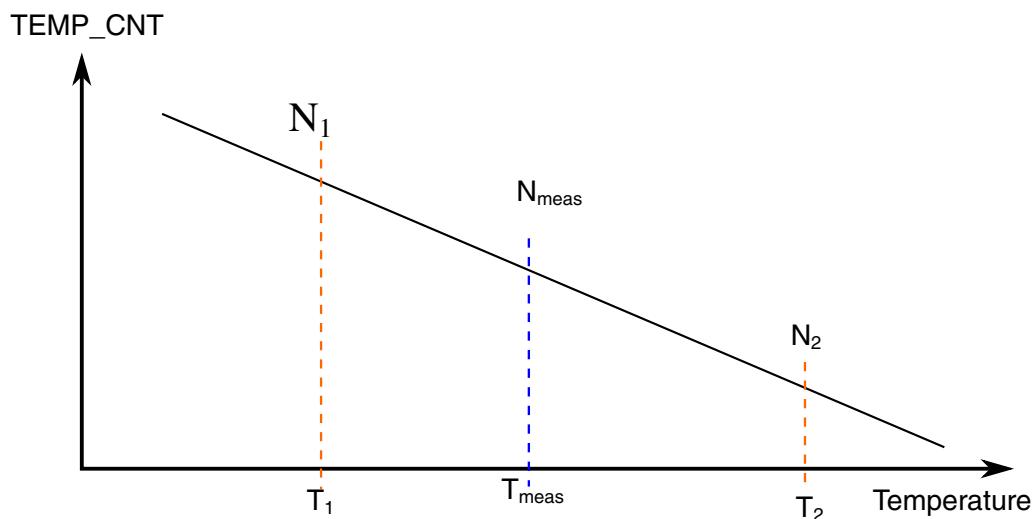

**Figure 19-1. High Level Temp Sensor System Diagram**

As shown in the figure above, the temperature sensor uses and assumes that the bandgap reference, 480MHz PLL and 32KHz RTC modules are properly programmed and fully settled for correct operation.

## 19.3 Software Usage Guidelines

During normal system operation software can use the temperature sensor counter output (TEMP\_CNT) in conjunction with the fused temperature calibration data to determine the on-die operational temperature or to set an over-temperature interrupt alarm to within a couple of °C.

Based on calibration, two sets of temperature and counter values will be available via fuses on the device. These data points will correspond to the points ( $N_1, T_1$ ) and ( $N_2, T_2$ ) in the curve below.

**Figure 19-2. Temperature Measurement Cycle**

After a temperature measurement cycle, software should use the calibration points in conjunction with the temperature code value in the TEMPMON\_TEMPSENSE0[TEMP\_CNT] bitfield to calculate the temperature for the device using the following equation:

$$T_{\text{meas}} = T_2 - (N_{\text{meas}} - N_2) * ((T_2 - T_1) / (N_1 - N_2))$$

Likewise, to determine the alarm counter value to be written in the TEMPMON\_TEMPSENSE0 register for a temperature based interrupt, the above equation can be solved for the  $N_{\text{meas}}$  value that should be used based on the desired temperature trigger.

The temperature calibration point fuse values are available in the OCOTP\_ANA1 register. The temperature calibration values are fused individually for each part in the product testing process. The fields of this register are described in the following table.

**Table 19-2. OCOTP\_ANA1 Temperature Sensor Calibration Data**

Bit Range	Bit Mask	Name	Description
[31:20]	FFF0_0000h	ROOM_COUNT	Value of TEMPMON_TEMPSENSE0[TEMP_VALUE] after a measurement cycle at room temperature (25.0 °C).
[19:8]	000F_FF00h	HOT_COUNT	Value of TEMPMON_TEMPSENSE0[TEMP_VALUE] after a measurement cycle at the hot temperature, i.e. HOT_TEMP.
[7:0]	0000_00FFh	HOT_TEMP	The hot temperature test point. Each LSB equals 1 °C.

The points on the calibration curve are as follows.

- $(N_1, T_1) = (ROOM\_COUNT, 25.0)$
- $(N_2, T_2) = (HOT\_COUNT, HOT\_TEMP)$
- $(N_{meas}, T_{meas}) = (TEMP\_CNT, T_{meas})$

Substituting the fields from OCOTP\_ANA1 into the earlier equation results in the following:

$$T_{meas} = HOT\_TEMP - (N_{meas} - HOT\_COUNT) * ((HOT\_TEMP - 25.0) / (ROOM\_COUNT - HOT\_COUNT))$$

## 19.4 TEMPMON Memory Map/Register Definition

### TEMPMON memory map

### 19.4.1 Tempsensor Control Register 0 (TEMPMON\_TEMPSENSE0n)

This register defines the basic controls for the temperature sensor minus the frequency of automatic sampling which is defined in the tempsensor.

Address: 400D\_8000h base + 180h offset + (4d × i), where i=0d to 3d

## **TEMPMON\_TEMPSENSE0*n* field descriptions**

Field	Description
31–20 ALARM_VALUE	This bit field contains the temperature count (raw sensor output) that will generate a high alarm when TEMP_CNT is smaller than this field.
19–8 TEMP_CNT	This bit field contains the last measured temperature count.
7 -	This field is reserved. Reserved.
6 -	This field is reserved. Reserved.
5–3 -	This field is reserved. Reserved
2 FINISHED	Indicates that the latest temp is valid. This bit should be cleared by the sensor after the start of each measurement.
	0 <b>INVALID</b> — Last measurement is not ready yet.
	1 <b>VALID</b> — Last measurement is valid.
1 MEASURE_TEMP	Starts the measurement process. If the measurement frequency is zero in the TEMPSENSE1 register, this results in a single conversion.

*Table continues on the next page...*

**TEMPMON\_TEMPSENSE0n field descriptions (continued)**

Field	Description
	0 <b>STOP</b> — Do not start the measurement process. 1 <b>START</b> — Start the measurement process.
0 POWER_DOWN	This bit powers down the temperature sensor. 0 <b>POWER_UP</b> — Enable power to the temperature sensor. 1 <b>POWER_DOWN</b> — Power down the temperature sensor.

**19.4.2 Tempsensor Control Register 1 (TEMPMON\_TEMPSENSE1n)**

This register defines the automatic repeat time of the temperature sensor.

Address: 400D\_8000h base + 190h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
-------	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---

**TEMPMON\_TEMPSENSE1n field descriptions**

Field	Description
31–16 -	This field is reserved. Reserved.
MEASURE_FREQ	This bits determines how many RTC clocks to wait before automatically repeating a temperature measurement. The pause time before remeasuring is the field value multiplied by the RTC period.  0x0000 Defines a single measurement with no repeat. 0x0001 Updates the temperature value at a RTC clock rate. 0x0002 Updates the temperature value at a RTC/2 clock rate. ... — 0xFFFF Determines a two second sample period with a 32.768KHz RTC clock. Exact timings depend on the accuracy of the RTC clock.

**19.4.3 Tempsensor Control Register 2 (TEMPMON\_TEMPSENSE2n)**

This register defines the automatic repeat time of the temperature sensor.

Address: 400D\_8000h base + 290h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### NOTE

Tamper Detection feature and ZMK hardware programming not applicable on this device.

### 20.2 Overview

The Secure Non-Volatile Storage (SNVS) is a companion module to the DCP module.

The SNVS non-security functionality is described in this document, but the SNVS security functionality is described only in the Security Reference Manual.

#### 20.2.1 Block diagram

The following figure illustrates the structure of SNVS.

## Overview

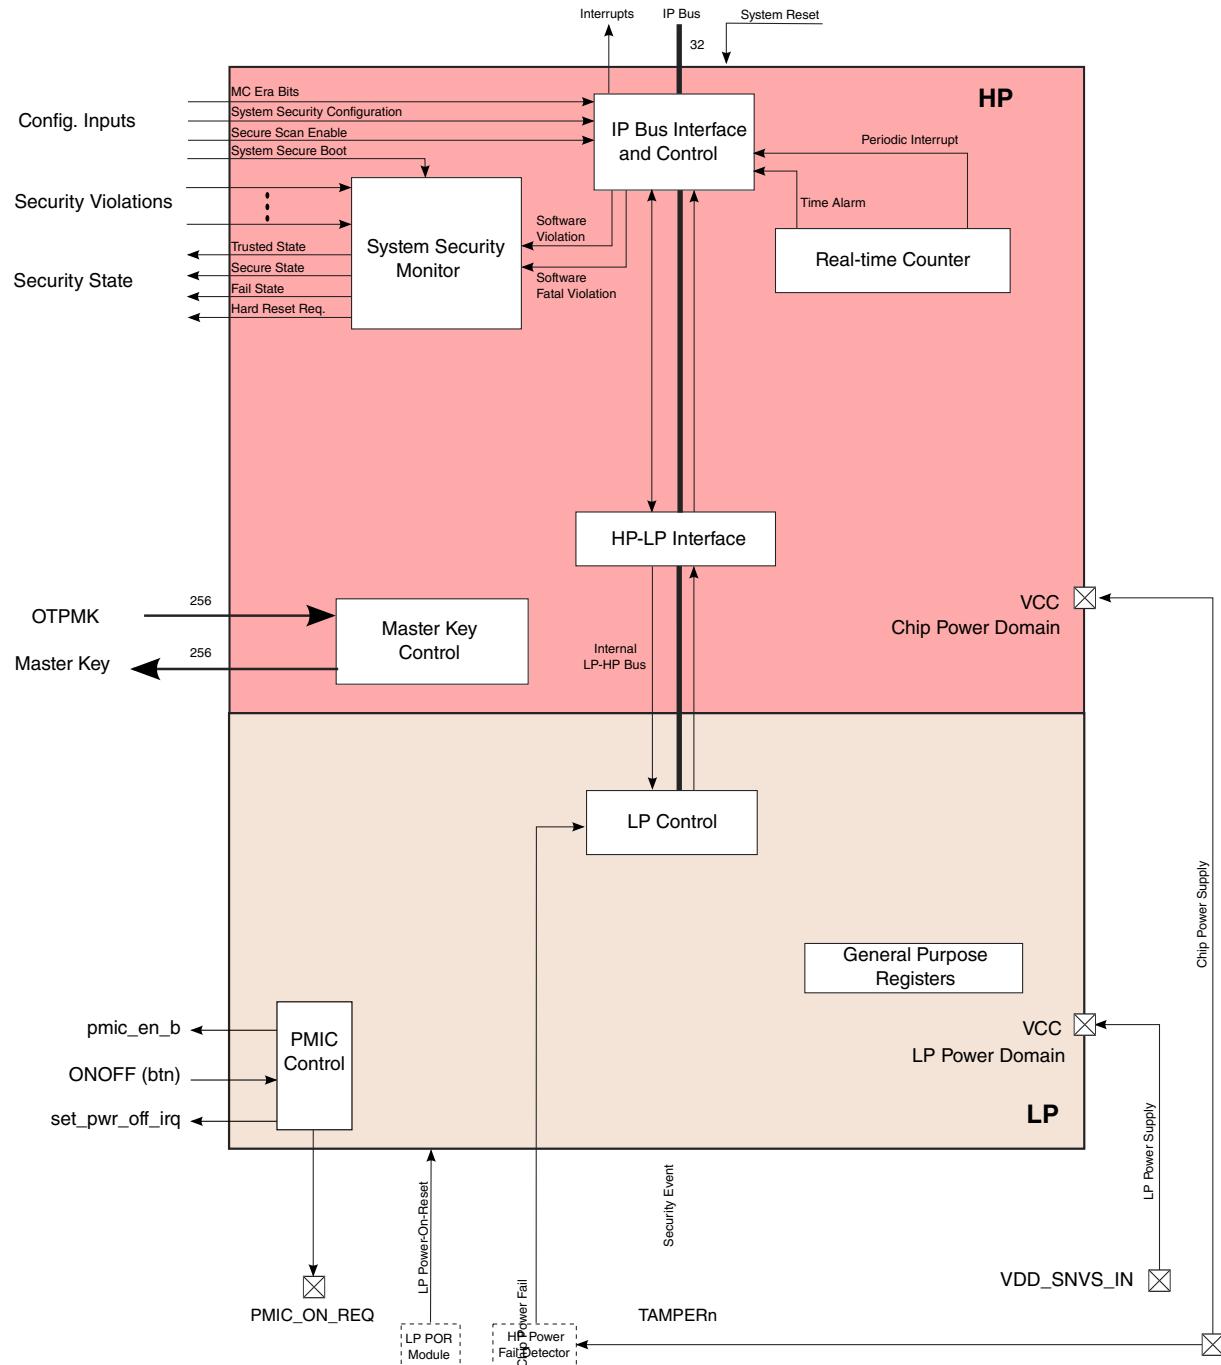

Figure 20-1. SNVS Block Diagram

## 20.2.2 Features

The following table summarizes the features of SNVS:

**Table 20-2. SNVS feature list**

Feature	Description	Links for Further Information
Real time counter (RTC)	<ul style="list-style-type: none"> <li>The RTC is driven by a dedicated clock, which is off when the system power is down.</li> <li>Programmable time alarm interrupt</li> <li>Periodic interrupt can be generated with software-selected frequency.</li> </ul>	<a href="#">SNVS_HP Real Time Counter</a>
General-purpose register	<ul style="list-style-type: none"> <li>The general-purpose register is available to software to store 256 bits of data.</li> <li>The general-purpose register is zeroized when a security violation is detected.</li> <li>If the SNVS_LP power input is connected to an uninterrupted power supply (see <a href="#">SNVS power domains</a>), the general-purpose register value is retained even if the main chip is powered down.</li> </ul>	<a href="#">Using the General-Purpose Register</a>
Register access restrictions	<ul style="list-style-type: none"> <li>Some registers/values can be written only once per boot cycle.</li> </ul>	<a href="#">privileged and non-privileged registers</a>
Wakeup from power off	<ul style="list-style-type: none"> <li>Input signal from off chip requests SNVS_LP to power on the main SoC (Assuming that the SNVS_LP power input is connected to an uninterrupted power supply (see <a href="#">SNVS power domains</a>)).</li> <li>Hardware debounces the input signal using software-specified signal bounce characteristics</li> </ul>	<a href="#">LP Wake-Up Interrupt Enable</a>

## 20.3 SNVS functional description

SNVS implements several non-security features that involve software interaction:

- reading or writing the Realtime Counter (RTC) (This is a non-privileged operation.) - software can also instruct SNVS to load the current SRTC value into the RTC
- reading or writing the General Purpose Register (GPR) (Note that there may be a significant delay when reading or writing registers in the LP section if the LP clock is different from the HP clock.)

The following sections describe in more detail the operation of SNVS.

### 20.3.1 SNVS power domains

In some versions of SNVS (including this version), the LP (Low Power) section is implemented in an independent power domain from the HP (High Power) section, and most other logic on the chip. Throughout the SNVS documentation whenever mention is made of "always-on" logic, this assumes a version of SNVS that implements an independent power domain for the LP section, and that the power for this section is supplied by an uninterrupted power supply. The purpose for the independent power domain is so that data can be retained and certain logic can remain functional even when the main chip logic is powered down. But this is possible only if the LP domain remains

powered via an uninterrupted power supply when the main chip power domain is powered off. Usually this uninterrupted power supply would be a battery, with possibly some power management logic to power the LP section from main power (and perhaps recharge the battery) when main power is on, and switch to battery power when the main power is off. In versions of SNVS with an independent LP power domain the LP section can be electrically isolated from the rest of the chip logic to ensure that its logic does not get corrupted when the main chip is powered down. If the battery runs down or is removed, an LP POR will occur when the LP section next powers up. Note that some OEMs may choose to connect LP power to HP/main chip power and dispense with a battery. In that case the SNVS will operate the same as an SNVS without an independent LP power domain. No state will be retained in the LP section when the chip is powered down, and an LP POR will occur whenever there is an HP POR.

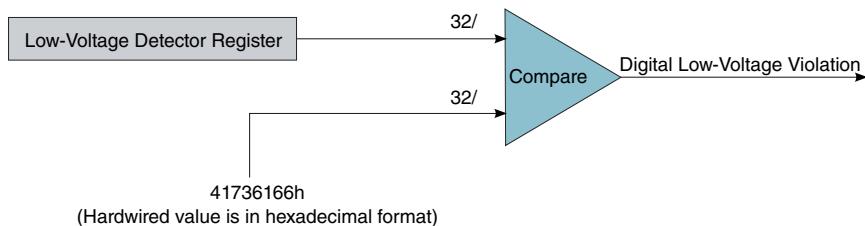

### **20.3.2 Digital Low-Voltage Detector (LVD)**

SNVS\_LP incorporates a mechanism to detect interruptions of the SNVS\_LP power supply that might cause the LP control, status, and secure counter values to change. The mechanism works as follows:

1. The LVD register (LPLVDR) is loaded with the known specific value 4173\_6166h as part of the SNVS initialization process.
2. Subsequently, this register's value is continuously compared to the hardwired value 4173\_6166h.
3. If the comparison indicates that any bit has changed, a low-voltage violation is asserted.

Digital low-voltage detection is always enabled and cannot be disabled. At LP POR this register is reset to all 0's, so the hardwired comparison fails and a low-voltage violation is reported. Therefore, before programming any feature in the SNVS the low-voltage violation should be cleared. The initialization software should write the proper value (4173\_6166h) into LPLVDR (see [SNVS\\_LP Digital Low-Voltage Detector Register \(LPLVDR\)](#)) and should then clear the low-voltage event record in the LP status register (see [SNVS\\_LP Status Register \(LPSR\)](#)).

The following figure shows the LVD mechanism.

**Figure 20-2. Digital low-voltage detector**

### 20.3.3 Runtime Procedures

SNVS implements a number of features that are intended to be accessed by software at runtime (as opposed to accessed at boot time). These features include:

- Real Time Clock (see [SNVS\\_HP Real Time Counter](#))
- General Purpose Register (see [Using the General-Purpose Register](#))

Procedures for using these features are described in the following sections.

#### 20.3.3.1 Using SNVS Timer Facilities

SNVS incorporates timer facilities that can optionally generate an interrupt at a specified time. As described in the following sections, SNVS\_HP incorporates a Real Time Counter that is available for general use, and SNVS\_LP incorporates a Secure Real Time Counter intended for security applications.

##### 20.3.3.1.1 SNVS\_HP Real Time Counter

SNVS\_HP implements a real time counter that can be read or written by any application; it has no privileged software access restrictions. When the chip is powered down the RTC is not active and it is reset at chip POR. The RTC can be used to generate a functional interrupt request either at a specific time, or at a specific frequency, or both. To generate an interrupt request at a specific time HPTA\_EN is set to 0, the desired time is written to HPTA\_MS and HPTA\_LS and then HPTA\_EN is set to 1. HPTA\_EN, HPTA\_MS and HPTA\_LS can be written by any software that has access to SNVS registers; there are no privileged access restrictions. The counter can be synchronized to the SNVS\_LP SRTC by writing to the HP\_TS bit of SNVS\_HP Control Register. This is particularly useful if the SNVS\_LP is powered from an uninterrupted power source because the RTC can then be set from a chip-internal time source.

### 20.3.3.1.2 RTC/SRTC control bits setting

All SNVS registers are programmed from the register bus, consequently any software-initiated changes are synchronized with the IP clock. Several registers can also change synchronously with the RTC/SRTC clock after they are programmed. To avoid IP clock and RTC/SRTC clock synchronization issues, the following values can be changed only when the corresponding function is disabled.

**Table 20-3. RTC/SRTC synchronized values list**

Function	Value/register	Control bit setting
HP section		
HP Real Time Counter	HPRTCMR and HPRTCLR Registers	RTC_EN = 0 : HPRTCMR/HPRTCLR <b>can</b> be programmed RTC_EN = 1 : HPRTCMR/HPRTCLR <b>cannot</b> be programmed
HP Time Alarm	HPTAMR and HPTALR Registers	HPTA_EN = 0 : HPTAMR/HPTALR <b>can</b> be programmed HPTA_EN = 1 : HPTAMR/HPTALR <b>cannot</b> be programmed
LP section		
LP Secure Real Time Counter	LPRTCMR and LPRTCLR Registers	SRTC_ENV = 0 : LPRTCMR/LPRTCLR <b>can</b> be programmed SRTC_ENV = 1 : LPRTCMR/LPRTCLR <b>cannot</b> be programmed
LP Time Alarm	LPTAR Register	LPTA_EN = 0 : LPTAR <b>can</b> be programmed LPTA_EN = 1 : LPTAR <b>cannot</b> be programmed

Use the following steps to program synchronized values:

1. Check the enable bit value. If set, clear it.
2. Verify that the enable bit is cleared. There are two reasons to verify the enable bit's setting:
  - Enable bit clearing does not happen immediately; it takes three IP clock cycles and two RTC/SRTC clock cycles to change the enable bit's value.
  - If the enable bit is locked for programming, it cannot be cleared.
3. Program the desired value.
4. Set the enable bit; it takes three IP clock cycles and two RTC/SRTC clock cycles for the bit to set.

**NOTE**

Incrementing the value programmed into RTC/SRTC registers by two compensates for the two RTC/SRTC clock cycle delay that is required to enable the counter.

### **20.3.3.1.3 Reading RTC and SRTC values**

Software should follow the following procedure to ensure that it has read correct data from the RTC (HPRTCMR and HPRTCLR) and SRTC (LPSRTCMR and LPSRTCLR) registers:

- Read the most-significant half and the least-significant half of the RTC/SRTC and then read both halves again. If the values read are the same both times, the value is correct.
- If the two consecutive pairs of reads yield different results, perform two more reads.

The worst case scenario may require three sessions of two consecutive pairs of reads. There are several reasons that the values may be incorrectly read initially:

- Synchronization issues between the RTC/SRTC clock and the system clock
- Since the counter continues to increment, there may be a carry from the least-significant 32-bits to the most-significant bits in between reading the two halves of the counter

### **20.3.3.2 Using Other SNVS Registers**

The sections below describe how to use the General Purpose Register.Monotonic Counter.The sections below describe how to use the General Purpose Register and the Monotonic Counter.

#### **20.3.3.2.1 Using the General-Purpose Register**

SNVS implements a 256-bit general-purpose register allows software to store a small amount of data. To maintain backward compatibility with versions of SNVS that implement only a 32-bit general purpose register, the most-significant word of the general purpose register is aliased to the original legacy address, and to maintain backward compatibility with versions of snvs\_module\_name that implement a 128-bit general purpose register, the most-significant half of the general purpose register is aliased to the previous legacy address address. The data in the GPR will be retained during system power-down mode as long as the SNVS\_LP remains powered by an uninterrupted power source.

## 20.3.4 Clocks

The SNVS has the following clock sources:

- System peripheral clock input. This clock is used by the SNVS's internal logic, for example, the Security State Machine. This clock can be gated outside of the module when the SNVS indicates that it is not in use.
- HP RTC clock. This clock is used by SNVS\_HP real-time counter. This clock does not need to be synchronous with other clocks.

## 20.3.5 Reset

The table below shows the different resets associated with this module.

**Table 20-4. Reset summary**

Reset	Source	Characteristics	Internally resets
HP hard	ipg_hard_async_re set_b	active-low, asynchronous	All SNVS_HP and SNVS_LP registers and flops.
LP Power On Reset (POR)	lp_por_b	active-low, asynchronous	All SNVS_LP registers and flops.
LP software reset	software	active-high, synchronous, one cycle	All SNVS_LP registers and flops. The LP software reset can be asserted if not disabled.

## 20.4 External Signals

**Table 20-5. External Signals**

Signal	Description	Direction
TAMPERn	External Tamper signals	I
PMIC_ON_REQ	PMIC ON Request signal	I

## 20.5 Initialization of SNVS

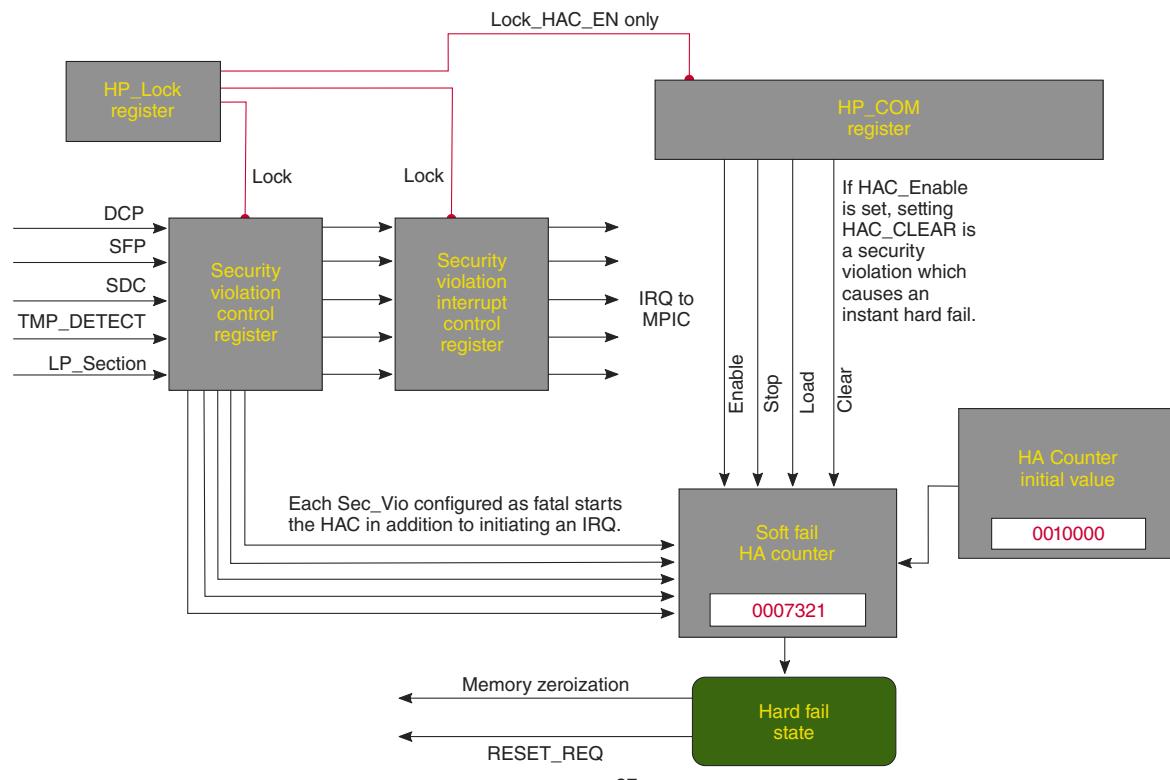

SNVS is implemented in two sections (HP and LP) that both must be initialized by software. If the SNVS\_LP is powered by an uninterrupted power source that is separate from main SoC power, then SNVS can operate in either of two modes, depending upon whether the main SoC power is on or off.

- During main SoC power-down SNVS\_HP is powered-down, but SNVS\_LP is powered from the backup power supply and is electrically isolated from the rest of the chip. In this mode SNVS\_LP keeps its registers' values but the LP registers cannot be read or written.
- During main SoC power-up the isolation of SNVS\_LP is disabled and both SNVS\_HP and SNVS\_LP are powered from the main SoC power. Both LP and HP registers can be read and written (locks and privilege modes permitting). Signals between the SNVS\_HP and SNVS\_LP sections are enabled and all SNVS functions are operational.

Since the HP and LP sections reside in different power domains, the POR for the two sections can occur at different times. If the SNVS\_LP section remains powered by an uninterrupted power source when the main SoC power is off, SNVS\_LP is initialized rarely, typically once when the device is first powered on and again whenever the battery is replaced. During main SoC power-up the isolation of SNVS\_LP is disabled and both SNVS\_HP and SNVS\_LP are powered from the main SoC power. Signals between the SNVS\_HP and SNVS\_LP sections are enabled and all SNVS functions are operational. The SNVS\_HP section is powered from the main SoC power, so it must be initialized after the device is powered on. If the SNVS\_LP section is powered from the main SoC power rather than from an uninterrupted power source, the SNVS\_LP section must also be initialized at SoC POR.

- Initializing the LP section
  - The following steps should be completed to properly initialize the SNVS LP section (required only on LP POR, i.e. when the battery is replaced):
    - Software should write the proper initialization value (41736166h) into the [LP Digital Low-Voltage Detector Register](#) and clear the low-voltage event record in the [LP status register](#). See [Digital Low-Voltage Detector \(LVD\)](#) for more details.
- Initializing the HP section
  - The following steps should be completed to properly initialize the SNVS HP section (required on HP POR, i.e. SoC POR):
    - Perform normal boot to put the SNVS into a functional state (Non-secure, Trusted, Secure) (see [HP Command Register](#), SSM\_ST bitfield).
    - Program SNVS general functions/configurations (see [HP Control Register](#)).

## Memory Map and register definition

27

**Figure 20-3. Relationship Between the Registers**

## 20.6 Memory Map and register definition

This section contains detailed register descriptions for the SNVS registers. Each description includes a standard register diagram and register table. The register table provides detailed descriptions of the register bit and field functions, in bit order.

SNVS registers consist of two types:

- Privileged read/write accessible
- Non-privileged read/write accessible

Privileged read/write accessible registers can only be accessed for read/write by privileged software. Unauthorized write accesses are ignored, and unauthorized read accesses return zero. Non-privileged software can access privileged access registers when the non-privileged software access enable bit is set in the SNVS\_HP Command Register.

- Non-Secure
- Trusted
- Secure

Non-privileged read/write accessible registers are read/write accessible by any software.

The LP register values are set only on LP POR and are unaffected by System (HP) POR. The HP registers are set only on System POR and are unaffected by LP POR.

The following table shows the SNVS main memory map.

### NOTE

For more information on security-related bitfields, see the Security Reference Manual.

## 20.6.1 SNVS register descriptions

### 20.6.1.1 SNVS memory map

### 20.6.1.3 SNVS\_HP Control Register (HPCR)

The SNVS\_HP Control Register contains various control bits of the HP section of SNVS. This is *not* a privileged write register.

#### 20.6.1.3.1 Offset

Register	Offset
HPCR	8h

#### 20.6.1.3.2 Diagram

#### 20.6.1.3.3 Fields

Field	Description
31-28	Reserved
—	
27 BTN_MASK	Button interrupt mask. This bit is used to mask the button (BTN) interrupt request. 0: Interrupt disabled 1: Interrupt enabled
26-24 BTN_CONFIG	Button Configuration. This field is used to configure which feature of the button (BTN) input signal constitutes "active".

Table continues on the next page...

Field	Description
	000: Button signal is active high 001: Button signal is active low 010: Button signal is active on the falling edge 011: Button signal is active on the rising edge 100: Button signal is active on any edge All other patterns are Reserved
23-17 —	Reserved
16 —	Reserved
15 —	Reserved
14-10 HPCALB_VAL	<b>HP Calibration Value</b> Defines signed calibration value for the HP Real Time Counter. This field can be programmed only when RTC Calibration is disabled (HPCALB_EN is not set). This is a 5-bit 2's complement value, hence the allowable calibration values are in the range from -16 to +15 counts per 32768 ticks of the counter. 00000 - +0 counts per each 32768 ticks of the counter 00001 - +1 counts per each 32768 ticks of the counter 00010 - +2 counts per each 32768 ticks of the counter 01111 - +15 counts per each 32768 ticks of the counter 10000 - -16 counts per each 32768 ticks of the counter 10001 - -15 counts per each 32768 ticks of the counter 11110 - -2 counts per each 32768 ticks of the counter 11111 - -1 counts per each 32768 ticks of the counter
9 —	Reserved
8 HPCALB_EN	<b>HP Real Time Counter Calibration Enabled</b> Indicates that the time calibration mechanism is enabled. 0 - HP Timer calibration disabled 1 - HP Timer calibration enabled
7-4 PI_FREQ	<b>Periodic Interrupt Frequency</b> Defines frequency of the periodic interrupt. The interrupt is generated when a zero-to-one or one-to-zero transition occurs on the selected bit of the HP Real Time Counter and Real Time Counter and Periodic Interrupt are both enabled (RTC_EN and PI_EN are set). It is recommended to program this field when Periodic Interrupt is disabled (PI_EN is not set). The possible frequencies are: 0000 - bit 0 of the HPRTCLR is selected as a source of the periodic interrupt 0001 - bit 1 of the HPRTCLR is selected as a source of the periodic interrupt 0010 - bit 2 of the HPRTCLR is selected as a source of the periodic interrupt 0011 - bit 3 of the HPRTCLR is selected as a source of the periodic interrupt 0100 - bit 4 of the HPRTCLR is selected as a source of the periodic interrupt 0101 - bit 5 of the HPRTCLR is selected as a source of the periodic interrupt

*Table continues on the next page...*

## Memory Map and register definition

Field	Description
	0110 - - bit 6 of the HPRTCLR is selected as a source of the periodic interrupt 0111 - - bit 7 of the HPRTCLR is selected as a source of the periodic interrupt 1000 - - bit 8 of the HPRTCLR is selected as a source of the periodic interrupt 1001 - - bit 9 of the HPRTCLR is selected as a source of the periodic interrupt 1010 - - bit 10 of the HPRTCLR is selected as a source of the periodic interrupt 1011 - - bit 11 of the HPRTCLR is selected as a source of the periodic interrupt 1100 - - bit 12 of the HPRTCLR is selected as a source of the periodic interrupt 1101 - - bit 13 of the HPRTCLR is selected as a source of the periodic interrupt 1110 - - bit 14 of the HPRTCLR is selected as a source of the periodic interrupt 1111 - - bit 15 of the HPRTCLR is selected as a source of the periodic interrupt
3 PI_EN	HP Periodic Interrupt Enable The periodic interrupt can be generated only if the HP Real Time Counter is enabled. 0 - HP Periodic Interrupt is disabled 1 - HP Periodic Interrupt is enabled
2 DIS_PI	Disable periodic interrupt in the functional interrupt 0 - Periodic interrupt will trigger a functional interrupt 1 - Disable periodic interrupt in the function interrupt
1 HPTA_EN	HP Time Alarm Enable When set, the time alarm interrupt is generated if the value in the HP Time Alarm Registers is equal to the value of the HP Real Time Counter. This bit syncs with the 32KHz clock. It won't update with the bus clock. 0 - HP Time Alarm Interrupt is disabled 1 - HP Time Alarm Interrupt is enabled
0 RTC_EN	HP Real Time Counter Enable. This bit syncs with the 32KHz clock. It won't update with the bus clock. 0 - RTC is disabled 1 - RTC is enabled

### 20.6.1.4 SNVS\_HP Status Register (HPSR)

The HP Status Register reflects the internal state of the SNVS. This is *not* a privileged write register.

### 20.6.1.10 SNVS\_LP Control Register (LPCR)

The SNVS\_LP Control Register contains various control bits of the LP section of SNVS. This is a privileged write register.

### 20.6.1.10.1 Offset

Register	Offset
LPCR	38h

### 20.6.1.10.2 Diagram

### 20.6.1.10.3 Fields

Field	Description
31-25 —	Reserved
24 —	Reserved
23 PK_OVERRIDE	The value written to PK_OVERRIDE will be asserted on output signal snvs_lp_pk_override. That signal is used to override the IOMUX control for the PMIC I/O pad.
22 PK_EN	The value written to PK_EN will be asserted on output signal snvs_lp_pk_en. That signal is used to turn off the pullup/pulldown circuitry in the PMIC I/O pad.
21-20 ON_TIME	The ON_TIME field is used to configure the period of time after BTN is asserted before pmic_en_b is asserted to turn on the SoC power. 00: 500msec off->on transition time 01: 50msec off->on transition time 10: 100msec off->on transition time

Table continues on the next page...

Field	Description
	11: 0msec off->on transition time
19-18 DEBOUNCE	This field configures the amount of debounce time for the BTN input signal. 00: 50msec debounce 01: 100msec debounce 10: 500msec debounce 11: 0msec debounce
17-16 BTN_PRESS_TI ME	This field configures the button press time out values for the PMIC Logic. 00 : 5 secs 01 : 10 secs 10 : 15 secs 11 : long press disabled (pmic_en_b will not be asserted regardless of how long BTN is asserted)
15 —	Reserved
14-10 —	Reserved
9 —	Reserved
8 —	Reserved
7 LVD_EN	Digital Low-Voltage Event Enable By default the detection of a low-voltage event does not cause the pmic_en_b signal to be asserted. Setting the Digital Low-Voltage Event Enable bit to 1 enables the low-voltage event for the PMIC. 0 - disabled 1 - enabled
6 TOP	Turn off System Power Asserting this bit causes a signal to be sent to the Power Management IC to turn off the system power. This bit will clear once power is off. This bit is only valid when the Dumb PMIC is enabled. 0 - Leave system power on. 1 - Turn off system power.
5 DP_EN	Dumb PMIC Enabled When set, software can control the system power. When cleared, the system requires a Smart PMIC to automatically turn power off. 0 - Smart PMIC enabled. 1 - Dumb PMIC enabled.
4 —	Reserved
3 LPWUI_EN	LP Wake-Up Interrupt Enable This interrupt line should be connected to the external pin and is intended to inform the external chip about an SNVS_LP event (MC rollover, SRTC rollover, or time alarm). This wake-up signal can be asserted only when the chip (HP section) is powered down, and the LP section is isolated. 0 LP wake-up interrupt is disabled.

Table continues on the next page...

## Memory Map and register definition

Field	Description
	1 LP wake-up interrupt is enabled.
2 MC_ENV	Monotonic Counter Enabled and Valid  When set, the MC can be incremented (by write transaction to the LPSMCMR or LPSMCLR). Once MC_SL or MC_HL bit is set this bit can be changed only by LP POR.  0 - MC is disabled or invalid. 1 - MC is enabled and valid.
1 —	Reserved
0 —	Reserved

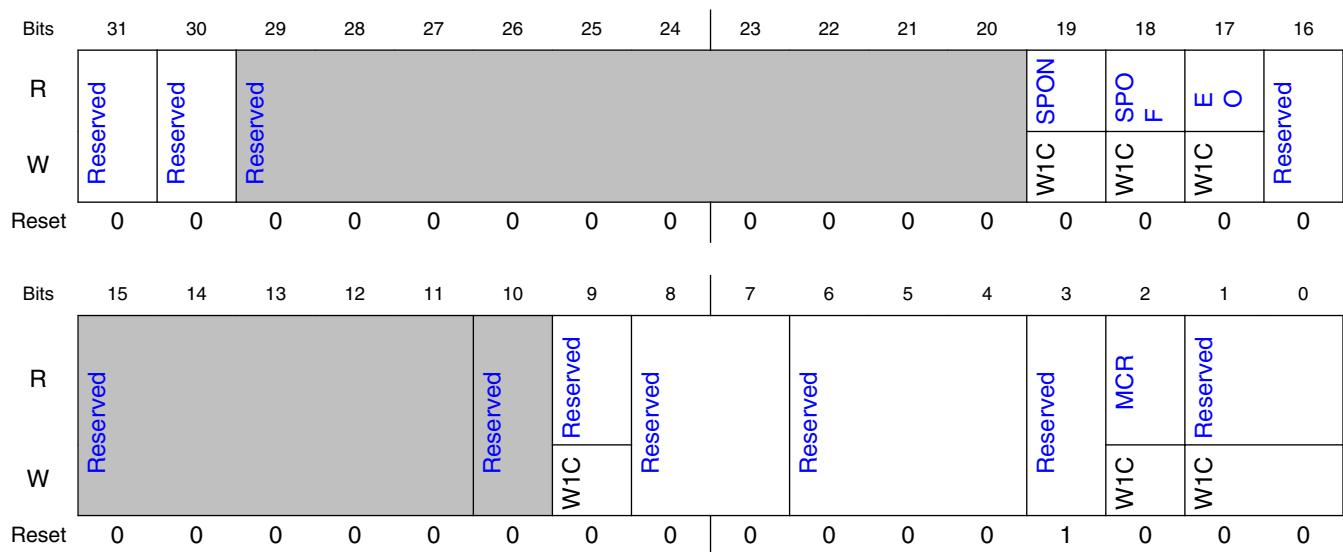

### 20.6.1.11 SNVS\_LP Status Register (LPSR)

The SNVS\_LP Status Register reflects the internal state and behavior of the SNVS\_LP. This is a privileged write register.

## 20.6.1.12 SNVS\_LP Secure Monotonic Counter MSB Register (LPSMCMR)

The SNVS\_LP Secure Monotonic Counter MSB Register contains the monotonic counter era bits and the most-significant 16 bits of the monotonic counter. The monotonic counter is incremented by one if there is a write command to the LPSMCMR or LPSMCLR register. This is a non-privileged read-only register.

### 20.6.1.12.1 Offset

Register	Offset
LPSMCMR	5Ch

### 20.6.1.12.2 Diagram

### 20.6.1.12.3 Fields

Field	Description
31-16	Monotonic Counter Era Bits
MC_ERA_BITS	

*Table continues on the next page...*

Field	Description
	<p>These bits are inputs to the module and typically connect to fuses. When the Monotonic Counter is in use (i.e. enabled and valid and powered by an uninterrupted power source), and the boot software detects that the Monotonic Counter most-significant 16 Bits and Monotonic Counter LSB Register have been reset (MC_ENV=0), the boot software can take action to ensure that the value in the monotonic counter remains monotonic (i.e. never decreasing). The action is to blow an additional MCERA_BITS fuse. Since the MCERA_BITS field forms the most-significant field of the monotonic counter, blowing an additional fuse guarantees that the new monotonic counter value is higher than any previous value.</p>
15-0 MON_COUNTE R	<p>Monotonic Counter most-significant 16 Bits</p> <p><b>Note that writing to this register does not change the value of this field to the value that was written.</b></p> <p>The 48-bit monotonic counter value (consisting of LPSMCMR[MON_COUNTER] prepended to LPSMCLR[MON_COUNTER]) is incremented by one when:</p> <ul style="list-style-type: none"> <li>• A write transaction to the LPSMCMR or LPSMCLR register is detected.</li> <li>• The MC_ENV bit is set.</li> <li>• MC_SL and MC_HL bits are not set.</li> </ul> <p>This value can be reset only by LP POR.</p>

### 20.6.1.13 SNVS\_LP Secure Monotonic Counter LSB Register (LPSMCLR)

The SNVS\_LP Secure Monotonic Counter LSB Register contains the 32 least-significant bits of the monotonic counter. The MC is incremented by one if there is a write command to the LPSMCMR or LPSMCLR register. This is a non-privileged read-only register.

#### 20.6.1.13.1 Offset

Register	Offset
LPSMCLR	60h

### 20.6.1.16.3 Fields

Field	Description
31-0	General Purpose Register
GPR	When GPR_SL or GPR_HL bit is set, the register cannot be programmed.

## 20.6.1.17 SNVS\_LP General Purpose Registers 0 .. 7 (LPGPR0 - LPGPR7)

The SNVS\_LP General Purpose Register is a 256-bit read/write register located in SNVS\_LP, which can be used by any application for retaining data during an SoC power-down mode. This is a privileged read/write register. The full GPR register is accessed as 8 32-bit registers located in successive word addresses starting at offset 100h. For backward compatibility with earlier versions of SNVS, LPGPR0..LPGPR3 are aliased at the earlier offset of 90h and LPGPR0 is also aliased at its original offset of 68h. New software should access the GPR register at the preferred offset of 100h. The GPR will be automatically zeroized when an enabled security event occurs, unless GPR zeroization is disabled via the GPR\_Z\_DIS bit in the LP Control Register.

### 20.6.1.17.1 Offset

For a = 0 to 7:

Register	Offset

### 21.2 Overview

The System Reset Controller (SRC) is responsible for the generation of all the system reset signals and boot argument latching.

#### 21.2.1 Features

The SRC includes the following features.

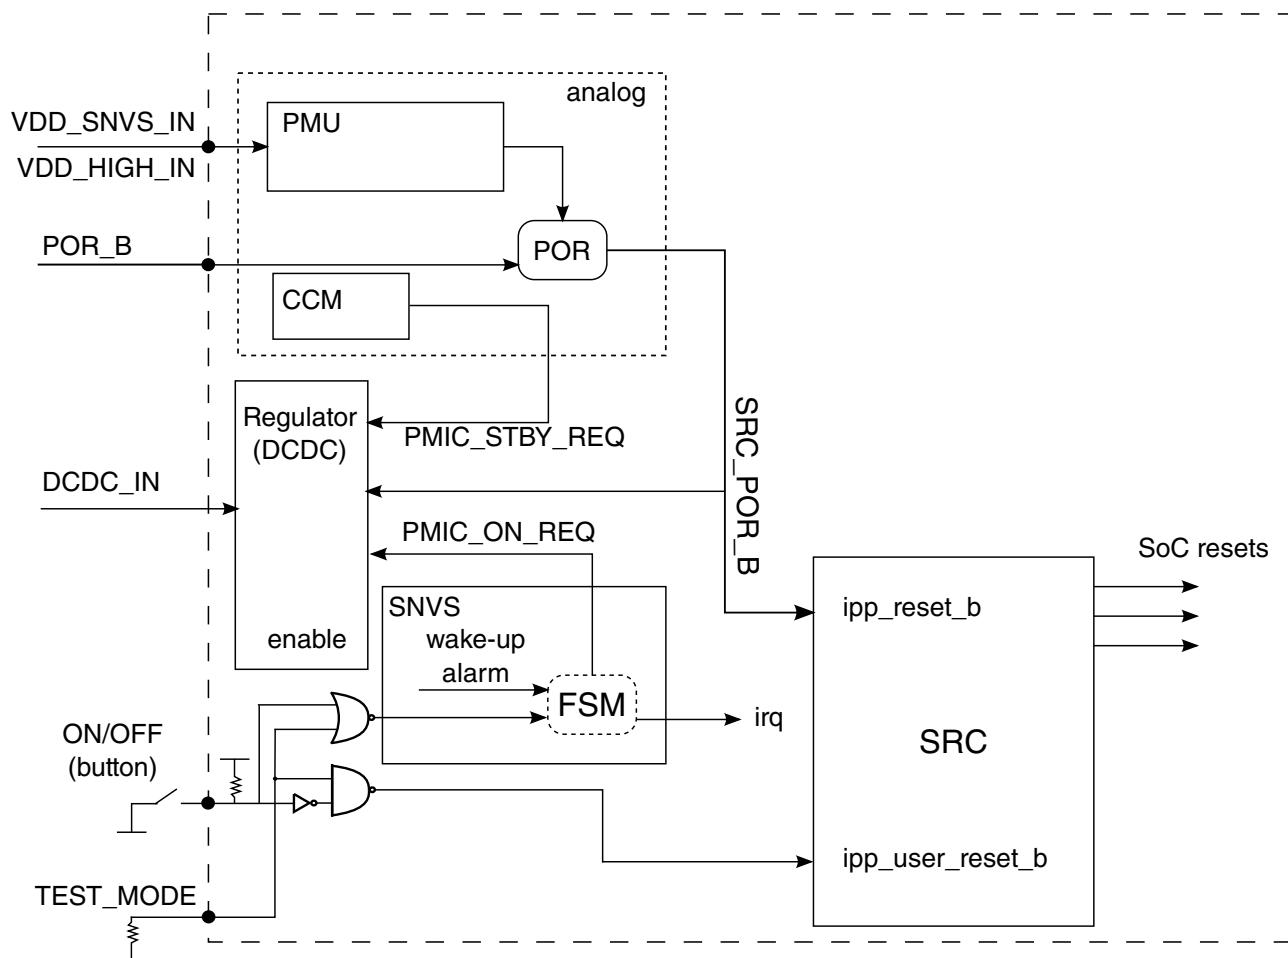

- Receives and handles the resets from all the reset sources
- Resets the appropriate domains based upon the resets sources and the nature of the reset
- Latches the SRC\_BOOT\_MODE pins and common configuration signals from the internal fuse

## 21.3 Functional Description

The reset controller determines the source and the type of reset, such as POR, COLD, and performs the necessary reset qualification and stretching sequences. Based on the type of reset, the reset logic generates the reset sequence for the entire IC. Whenever the chip is powered on, the reset is issued through SRC\_ONOFF signal and the entire chip is reset.

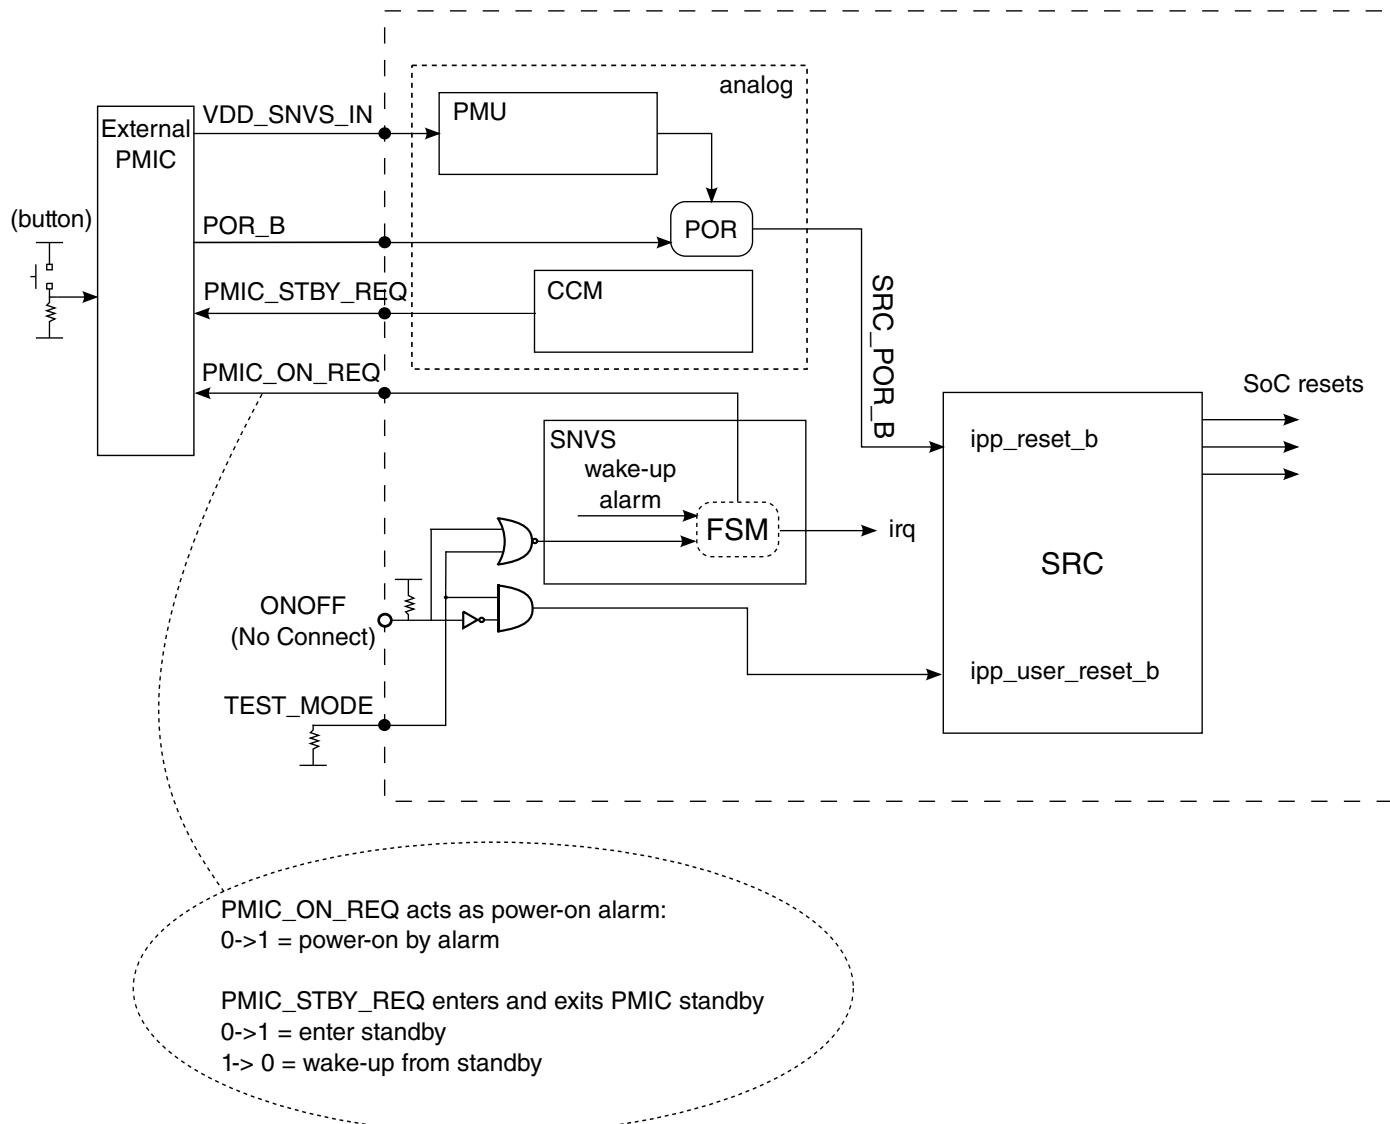

### 21.3.1 Reset and Power-up Flow

The chip presumes the following reset and power-up flow:

Note: PMIC\_ON\_REQ acts as an active high-signal  
 1 or high Z = ON  
 0 = OFF

**Figure 21-1. Chip reset scheme under PMU control**

**Figure 21-2. Chip reset scheme under external PMIC control**

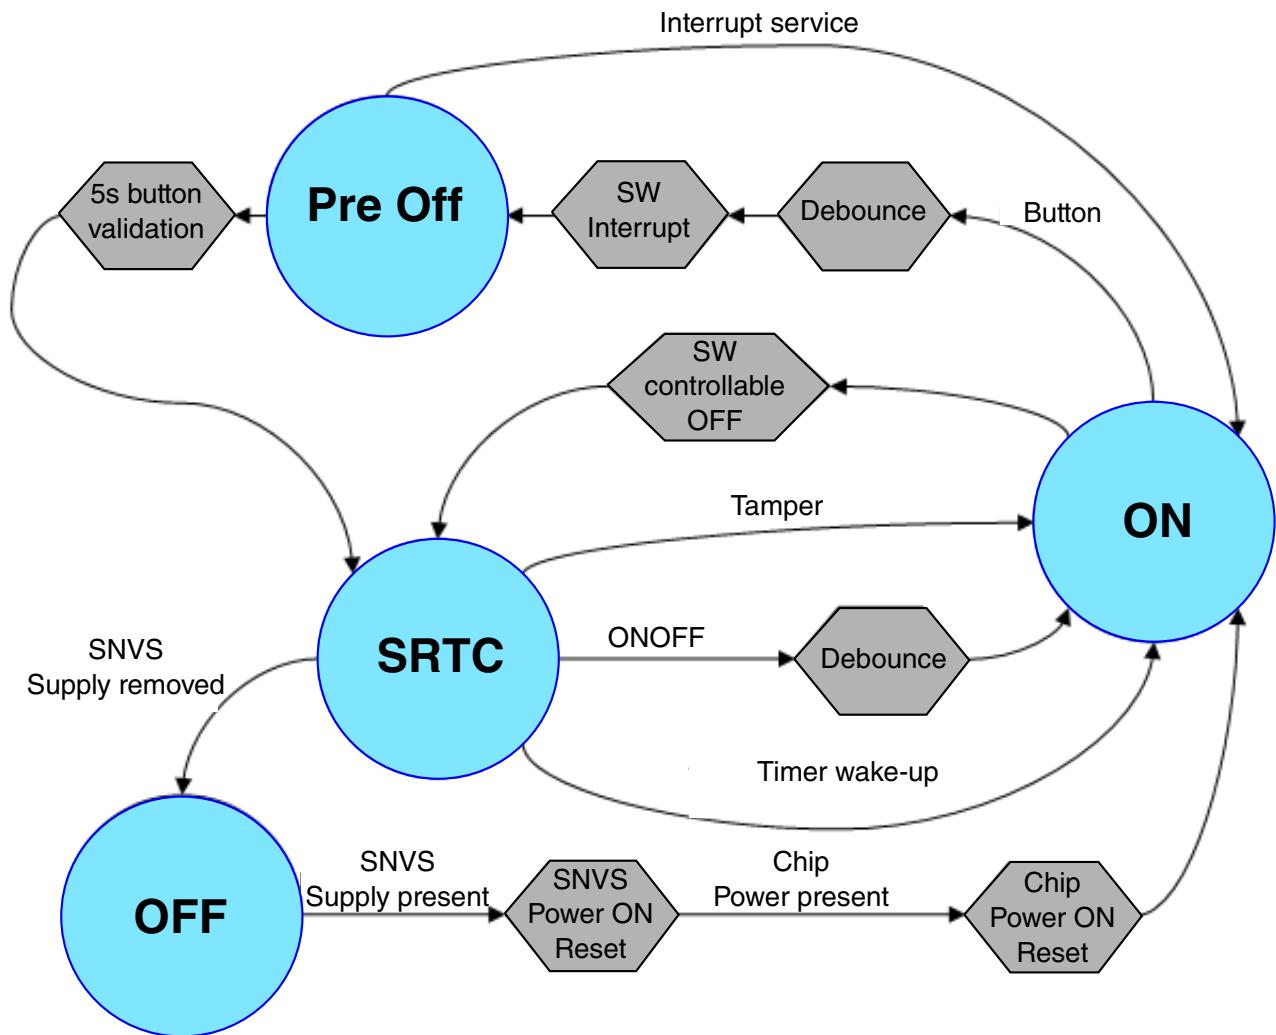

Figure 21-3. Chip on/off state flow diagram

### 21.3.2 Finite-State Machine (FSM)

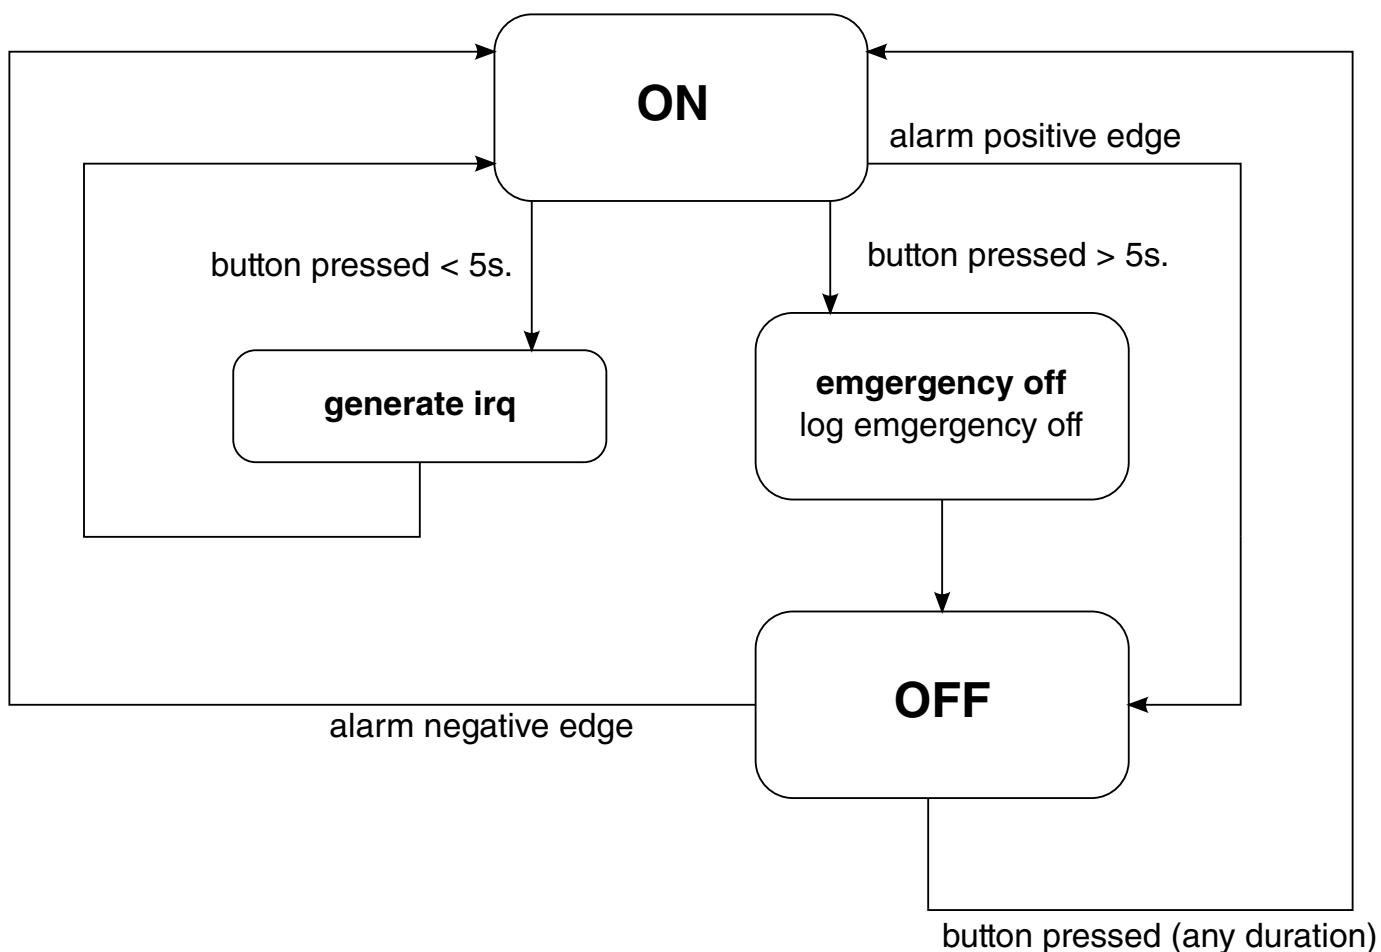

Figure 21-4. FSM

### 21.3.3 Power mode transitions

Table 21-2. Power mode transitions

Power mode	Configuration with external PMIC	Configuration with internal PMIC
ON, first time	<ol style="list-style-type: none"> <li>Either coin cell or SoC power supply is connected to SNVS.</li> <li>When button is pressed, PMIC powers on.</li> </ol>	<ol style="list-style-type: none"> <li>Either coin cell or SoC power supply is connected to SNVS, PMIC_ON_REQ goes to '1'.</li> <li>Drive DCDC_PSWITCH to high, 1 ms after DCDC_IN is powered.</li> <li>DCDC regulator is enabled.</li> </ol>
Normal ON to OFF, by button	<ol style="list-style-type: none"> <li>Button is pressed for a short duration on the external PMIC.</li> <li>Interrupt request (irq) is sent to SoC from external PMIC.</li> </ol>	<ol style="list-style-type: none"> <li>SOC button is pressed for a short duration.</li> <li>Interrupt request (irq) is sent to SoC from FSM.</li> <li>Alarm timer is set up by software routine and started.</li> </ol>

Table continues on the next page...

**Table 21-2. Power mode transitions (continued)**

Power mode	Configuration with external PMIC	Configuration with internal PMIC
	3. SoC is programming PMIC for power off when standby is asserted. 4. In CCM STOP mode, Standby is asserted, PMIC gates SoC supplies.	4. Upon alarm_in assertion to '1', PMIC_ON_REQ goes '0'. 5. DCDC regulator goes OFF.
Emergency ON to OFF, by button	1. Button is pressed for an extended time on the external PMIC. 2. PMIC is powering off.	1. Button is pressed for longer than 5 seconds on the SoC. 2. FSM validates button pressed for 5 seconds. 3. Emergency power off is logged, PMIC_ON_REQ goes '0', alarm_mask goes '1'. 4. DCDC regulator goes OFF.
OFF to ON, by button	1. Button is pressed on the external PMIC. 2. PMIC powers ON.	1. Button is pressed on the SoC. 2. PMIC_ON_REQ goes '1', alarm_mask goes '0'. 3. DCDC regulator powers ON.
OFF to ON, by timer alarm	1. Timer alarm in SNVS is programmed by software before SoC goes OFF. 2. SoC enters OFF mode. 3. Upon timer limit, wake up alarm goes '0'. PMIC_ON_REQ goes '1'. 4. PMIC receives assertion of PMIC_ON_REQ and wakes up.	1. Timer alarm in SNVS is programmed by software before SoC goes OFF. 2. SoC enters OFF mode. 3. Upon timer limit, wake up alarm goes '0'. PMIC_ON_REQ goes '1'. 4. DCDC regulator is enabled by PMIC_ON_REQ = 1.

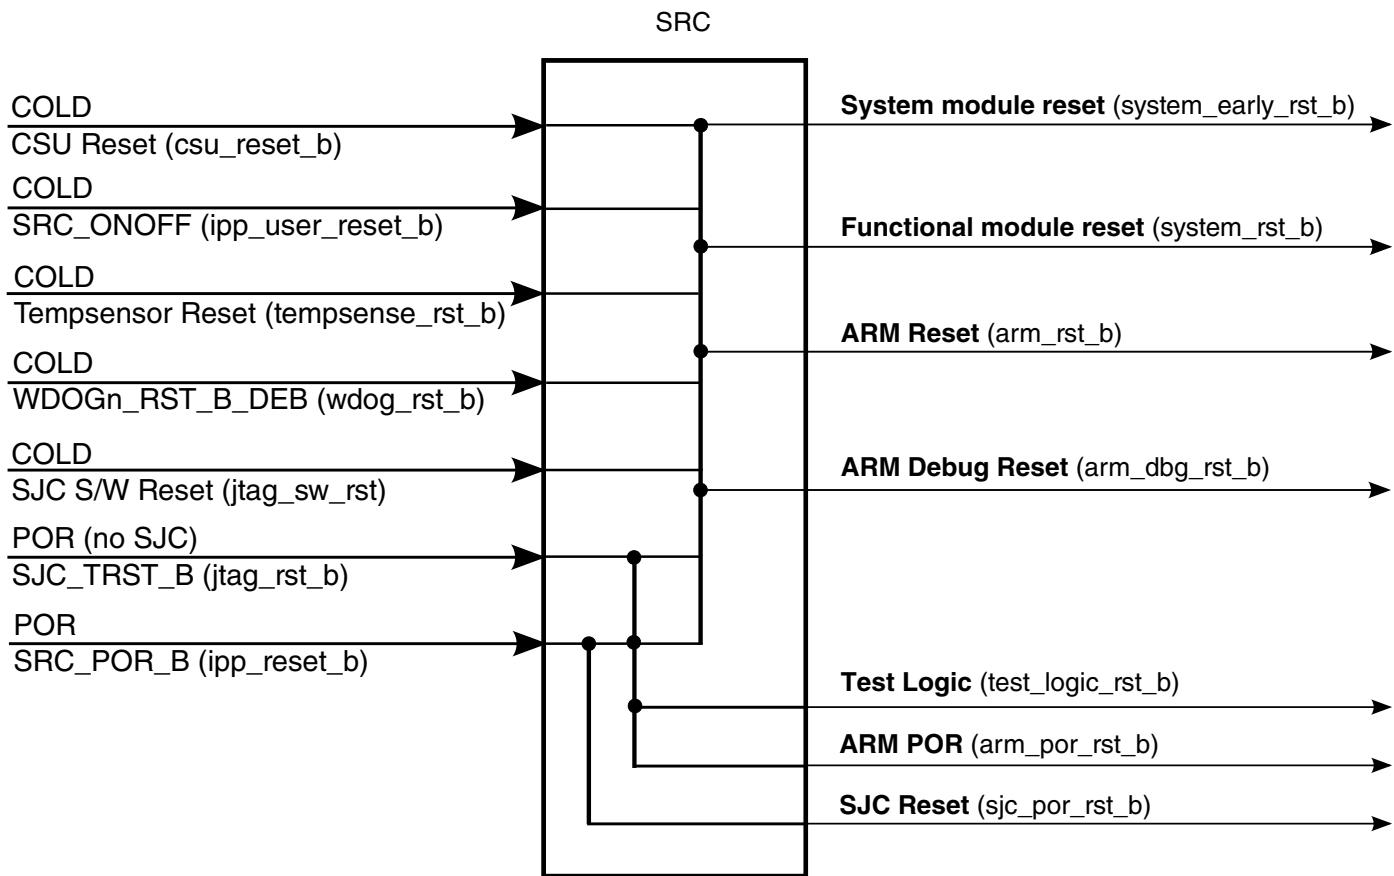

## 21.3.4 Reset Control

This section details the reset control of this device.

### 21.3.4.1 Reset inputs and outputs

The reset control logic receives reset requests from all potential reset sources. All the immediate sources of reset are directly passed to the reset stretching block, whereas the resets requiring qualification are passed on to the reset qualification logic before they are sent to the reset stretching block.

All reset inputs and outputs are described in the following figure:

**Figure 21-5. SRC inputs and outputs**

The reset types and modules they affect are shown in [Table 21-3](#).

#### NOTE

All resets are expected to be active low except jtag\_sw\_rst.

**Table 21-3. SRC reset functionality**

SoC Modules	POR	COLD
System modules (PLLs, fuses, etc)	yes	yes
Functional modules	yes	yes
Arm	yes	yes
IOMUXC	yes	no
Arm debug	yes	no
SJC	yes	no

The reset priorities are POR (strongest) and COLD (weakest). If a stronger reset is asserted during the sequence of a weaker reset, then the weaker sequence will be overridden, and the stronger reset sequence will commence. There is no priority within a reset type (POR, etc). If a reset is asserted during the reset sequence of the same type, the reset sequence will be interrupted and restarted.

The following lists the functionality of each of these reset outputs:

- system\_early\_rst\_b - Resets the system modules that need to start first as CCM, OCOTP\_CTRL, FUSEBOX, etc.
- system\_rst\_b - Resets functional modules
- arm\_rst\_b - Resets Arm module (on regular system reset)
- arm\_por\_rst\_b - Resets Arm POR input
- arm\_dbg\_rst\_b - Reset debug logic of Arm
- test\_logic\_rst\_b - Reset test logic (IOMUXC, DAP)
- sjc\_por\_rst\_b - Reset to SJC

### **NOTE**

It is assumed that each reset source will deassert after its assertion, either due to reset generated to the system from SRC, or by negation of the reset source (if it came from an external source to the chip). In the latter case, the reset source is assumed to be held for at least 2 XTALI clocks so it can be sampled by SRC.

## **21.3.4.2 Reset Handling**

### **21.3.4.2.1 POR (SRC\_POR\_B)**

SRC\_POR\_B is an external reset signal of the SRC module. When the chip is powered up, the reset signal is passed through the POR\_B pin indicating power-up sequence. The SRC resets the entire chip including the JTAG (SJC) module. All SRC registers will be reset during the POR sequence.

As soon as SRC\_POR\_B occurs, all resets are asserted and the entire chip is reset by SRC. The SRC\_POR\_B is stretched for 2 XTALI cycles and the stretching sequence takes place after 2 XTALI clocks of POR\_B pin deassertion.

The sjc\_por\_rst\_b signal is deasserted together with SRC\_POR\_B signal. The output is also deasserted after the stretching of SRC\_POR\_B has deasserted.

After the above resets deassert, system\_early\_rst\_b reset is deasserted after 2 XTALI clocks. The system\_early\_rst\_b is used for the CCM and PLL-IPs to start generating PLL clock ouputs and the system root clocks.

When the system root clocks are ready, the CCM will assert system\_clk\_ready signal. This signal is generated during the start sequence in the CCM and it involves the preparation of the PLLs to generate clock roots for functional operation.

SRC then enables OCOTP\_CTRL and fusebox clocks, so that fuses can be loaded to OCOTP\_CTRL.

- SRC will prepare the boot information
- After 8 ipg cycles, resets to all modules will be de-asserted
- After 8 ipg cycles, system clocks will be enabled (en\_system\_clk).

#### **21.3.4.2.2 COLD RESET**

The sequence is similar to SRC\_POR\_B except the IOMUXC, SJC and debug are not reset.

After the reset source deasserts, system\_early\_rst\_b reset is deasserted after at least 2 XTALI clocks. The system\_early\_rst\_b is used for the CCM and PLL-IPs to start generating PLL clock outputs and the system root clocks.

After the system root clocks are ready, the CCM will assert system\_clk\_ready signal. This signal is generated during the start sequence in the CCM and it involves the preparation of the PLLs to generate clock roots for functional operation. See CCM for more information.

After system\_clk\_ready arrives at the SRC, it will enable OCOTP\_CTRL and fusebox clocks, so that fuses can be loaded to OCOTP\_CTRL. OCOTP\_CTRL will notify with iim\_ready\_flag when the fusebox loading finishes.

- SRC will prepare the boot information
- After 8 ipg cycles resets to all modules will be deasserted
- After 8 ipg cycles, system clocks will be enabled (en\_system\_clk).

#### **21.3.5 Parallel Reset Requests**

SRC will follow the following rules in the case of parallel reset requests:

1. The order of strength of resets is POR - strongest, COLD - weakest
2. If a stronger reset is asserted during weaker reset sequence, then the stronger reset will take over and the stronger reset process will commence. The following cases fall into this category:
  - POR reset request in the middle of cold reset process - the cold will be stopped and the POR sequence will start.

3. If a weaker reset is asserted during stronger reset sequence, then the stronger reset sequence will continue without interference. If at the end of the stronger reset process the weaker request is still asserted then the weaker sequence will commence. The following cases fall into this category:
  - COLD reset requests in the middle of POR reset process - the POR process will continue without interference.
4. If a similar reset request is asserted during the process of reset handling, then the process of reset handling will start over (with the same process). The following cases fall into this category:
  - POR reset request in the middle of POR reset process - the POR process will start over.
  - COLD reset request in the middle of COLD reset process - the COLD process will start over.

## 21.3.6 Boot Mode Control

### 21.3.6.1 BOOT\_MODE Pin Latching

The exact boot sequence is controlled by the values of the BOOT\_MODE pins on this device.

The value of the BOOT\_MODE pins will be latched on de-assertion of POR reset. After latching, the values of the BOOT\_MODE pins are used to determine the booting options of the core as described in the SRC\_SBMRx registers.

The boot mode general purpose bits can be provided to the SRC from either e-fuses or GPIO signals. The gpio\_bt\_sel e-fuse defines the source to be used to derive the boot information. When gpio\_bt\_sel is set, e-fuses are used. When cleared, GPIO signals are used.

The boot information is provided in SRC\_SBMR1 and SRC\_SBMR2 registers. The figure below shows the selection of boot mode information.

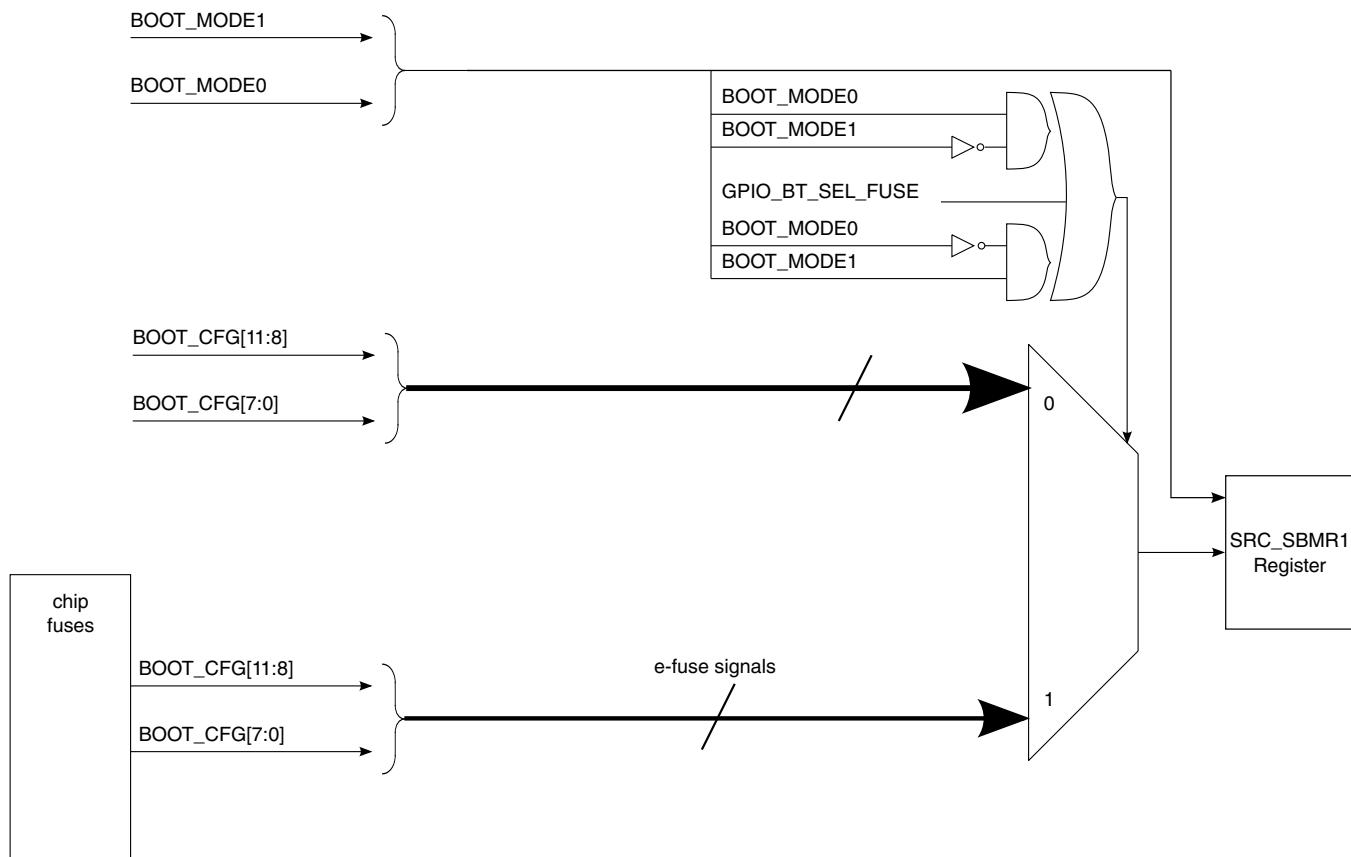

Figure 21-6. Boot mode information

### 21.3.7 Clocks

The table found here describes the clock sources for SRC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 21-4. SRC Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 21.4 External Signals

The following table describes the external signals of SRC.

**Table 21-5. SRC External Signals**

Signal	Description	Pad	Mode	Direction
SRC_BT_CFG0	Boot configuration signals  SRC_BT_CFG pins are not used with Teensy because BT_FUSE_SEL is programmed	GPIO_B0_04	ALT6	
SRC_BT_CFG1		GPIO_B0_05	ALT6	
SRC_BT_CFG2		GPIO_B0_06	ALT6	
SRC_BT_CFG3		GPIO_B0_07	ALT6	
SRC_BT_CFG4		GPIO_B0_08	ALT6	
SRC_BT_CFG5		GPIO_B0_09	ALT6	
SRC_BT_CFG6		GPIO_B0_10	ALT6

SRC_BT_CFG8		GPIO_B0_12	ALT6	
SRC_BT_CFG9		GPIO_B0_13	ALT6	
SRC_BT_CFG10		GPIO_B0_14	ALT6	
SRC_BT_CFG11		GPIO_B0_15	ALT6	
SRC_POR_B	Power on reset signal	POR_B	No Muxing (ALT0)	
SRC_ONOFF	ON/OFF signal	ONOFF	No Muxing (ALT0)	
SRC_BOOT_MODE0	Boot mode signals	GPIO_AD_B0_04	ALT0	
SRC_BOOT_MODE1		GPIO_AD_B0_05	ALT0	

## 21.5 Initialization

### 21.5.1 Power-On Reset and power sequencing

The SRC module generates an internal POR\_B signal that is logically AND'ed with any externally applied SRC\_POR\_B signal. The internal POR\_B signal will be held low until all of the following conditions are met:

- 4ms after the external power supply VDDHIGH\_IN is valid
- 1ms after the VDD\_SOC\_IN supply is valid

The 4ms and 1ms delays are derived from counting the 32 kHz RTC clock cycles; the accuracy depends on the accuracy of the RTC. When the RTC crystal is either absent or in the process of powering up, an internal ring oscillator will be the source of RTC, which is not as accurate as the crystal.

### 21.5.1.1 External POR using SRC\_POR\_B

If the external SRC\_POR\_B signal is used to control the processor POR, SRC\_POR\_B must remain low (asserted) until the VDD\_SOC supplies are stable.

### 21.5.1.2 Internal POR

If the external SRC\_POR\_B signal is not used (always held high or left unconnected), the processor defaults to the internal POR function (PMU controls generation of the POR based on the power supplies).

## 21.6 SRC Memory Map/Register Definition

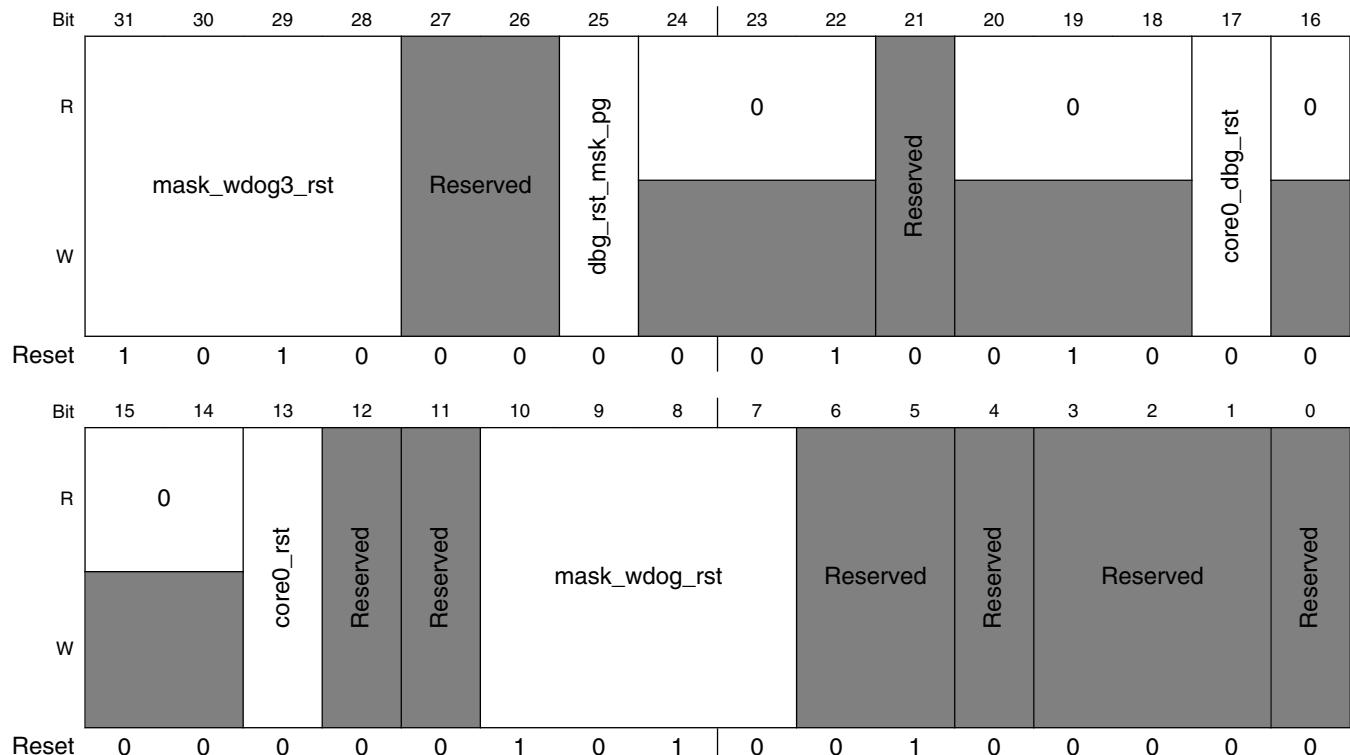

SRC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

## 21.6.1 SRC Control Register (SRC\_SCR)

The Reset control register (SCR), contains bits that control operation of the reset controller.

Address: 400F\_8000h base + 0h offset = 400F\_8000h

### SRC\_SCR field descriptions

Field	Description
31–28 mask_wdog3_rst	Mask wdog3_RST source. If these 4 bits are coded from A to 5 then, the wdog3_RST_b input to SRC will be masked and the wdog3_RST_b will not create a reset to the chip.  <b>NOTE:</b> Any other code than 0101 will be coded to 1010 i.e. wdog3_RST_b is not masked  0101 wdog3_RST_b is masked 1010 wdog3_RST_b is not masked
27–26 -	This field is reserved. Reserved
25 dbg_RST_msk_pg	Do not assert debug resets after power gating event of core  0 do not mask core debug resets (debug resets will be asserted after power gating event) 1 mask core debug resets (debug resets won't be asserted after power gating event)

Table continues on the next page...

**SRC\_SCR field descriptions (continued)**

Field	Description
24–22 Reserved	This read-only field is reserved and always has the value 0.
21 -	This field is reserved. Reserved
20–18 Reserved	This read-only field is reserved and always has the value 0.
17 core0_dbg_RST	Software reset for core0 debug only.  <b>NOTE:</b> This is a self clearing bit. After it is set to 1, the reset process will begin, and when it finishes, this bit will be self cleared.  0 do not assert core0 debug reset 1 assert core0 debug reset
16–14 Reserved	This read-only field is reserved and always has the value 0.
13 core0_RST	Software reset for core0 only.  <b>NOTE:</b> This is a self clearing bit. After it is set to 1, the reset process will begin, and when it finishes, this bit will be self cleared.  0 do not assert core0 reset 1 assert core0 reset
12 -	This field is reserved. Reserved
11 -	This field is reserved. Reserved
10–7 mask_wdog_RST	Mask wdog_RST_B source. If these 4 bits are coded from A to 5 then, the wdog_RST_B input to SRC will be masked and the wdog_RST_B will not create a reset to the chip.  <b>NOTE:</b> During the time the WDOG event is masked using SRC logic, it is likely that the WDOG Reset Status Register (WRSR) bit 1 (which indicates a WDOG timeout event) will get asserted. software / OS developer must prepare for this case. Re-enabling the WDOG is possible, by unmasking it in SRC, though it must be preceded by servicing the WDOG. However, for the case that the event has been asserted, the status bit (WRSR bit-1) will remain asserted, regardless of servicing the WDOG module.  (Hardware reset is the only way to cause the de-assertion of that bit). any other code will be coded to 1010 i.e. wdog_RST_B is not masked  0101 wdog_RST_B is masked 1010 wdog_RST_B is not masked (default)
6–5 -	This field is reserved. Reserved
4 -	This field is reserved. Reserved
3–1 -	This field is reserved. Reserved
0 -	This field is reserved. Reserved

## 21.6.2 SRC Boot Mode Register 1 (SRC\_SBMR1)

The Boot Mode register (SBMR) contains bits that reflect the status of Boot Mode Pins of the chip. The reset value is configuration dependent (depending on boot/fuses/IO pads).

If SRC\_GPR10[28] bit is set, this bit instructs the ROM code to use the SRC\_GPR9 register as if it is SBMR1. This allows software to override the fuse bits and boot from an alternate boot source.

Address: 400F\_8000h base + 4h offset = 400F\_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15–8 BOOT_CFG2[7:0]	Refer to fusemap.
BOOT_CFG1[7:0]	Refer to fusemap.

## 21.6.3 SRC Reset Status Register (SRC\_SRSR)

The SRSR is a write to one clear register which records the source of the reset events for the chip. The SRC reset status register will capture all the reset sources that have occurred. This register is reset on ipp\_reset\_b. This is a read-write register.

For bit[6-0] - writing zero does not have any effect. Writing one will clear the corresponding bit. The individual bits can be cleared by writing one to that bit. When the system comes out of reset, this register will have bits set corresponding to all the reset sources that occurred during system reset. Software has to take care to clear this register by writing one after every reset that occurs so that the register will contain the information of recently occurred reset.

Address: 400F\_8000h base + 8h offset = 400F\_8008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### SRC\_SRST field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 -	This field is reserved. Reserved
15–9 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

**SRC\_SRSR field descriptions (continued)**

Field	Description
8 tempsense_RST_B	Temper Sensor software reset. Indicates whether the reset was the result of software reset from on-chip Temperature Sensor. 0 Reset is not a result of software reset from Temperature Sensor. 1 Reset is a result of software reset from Temperature Sensor.
7 wdog3_RST_B	IC Watchdog3 Time-out reset. Indicates whether the reset was the result of the watchdog3 time-out event. 0 Reset is not a result of the watchdog3 time-out event. 1 Reset is a result of the watchdog3 time-out event.
6 jtag_SW_RST	JTAG software reset. Indicates whether the reset was the result of software reset from JTAG. 0 Reset is not a result of the mentioned case. 1 Reset is a result of the mentioned case.
5 jtag_RST_B	HIGH - Z JTAG reset. Indicates whether the reset was the result of HIGH-Z reset from JTAG. 0 Reset is not a result of HIGH-Z reset from JTAG. 1 Reset is a result of HIGH-Z reset from JTAG.
4 wdog_RST_B	IC Watchdog Time-out reset. Indicates whether the reset was the result of the watchdog time-out event. 0 Reset is not a result of the watchdog time-out event. 1 Reset is a result of the watchdog time-out event.
3 ipp_USER_RESET_B	Indicates whether the reset was the result of the ipp_user_reset_b qualified reset. 0 Reset is not a result of the ipp_user_reset_b qualified as COLD reset event. 1 Reset is a result of the ipp_user_reset_b qualified as COLD reset event.
2 csu_RESET_B	Indicates whether the reset was the result of the csu_reset_b input. 0 Reset is not a result of the csu_reset_b event. 1 Reset is a result of the csu_reset_b event.
1 lockup_SYSRESETREQ_EQ	Indicates a reset has been caused by CPU lockup or software setting of SYSRESETREQ bit in Application Interrupt and Reset Control Register of the Arm core. SW needs to write a value to SRC_GPR5 before writing the SYSRESETREQ bit and use the SRC_GPR5 value to distinguish if the reset is caused by SYSRESETREQ or CPU lockup. 0 Reset is not a result of the mentioned case. 1 Reset is a result of the mentioned case.
0 ipp_RESET_B	Indicates whether reset was the result of ipp_reset_b pin (Power-up sequence) 0 Reset is not a result of ipp_reset_b pin. 1 Reset is a result of ipp_reset_b pin.

## 21.6.4 SRC Boot Mode Register 2 (SRC\_SBMR2)

The Boot Mode register (SBMR), contains bits that reflect the status of Boot Mode Pins of the chip. The default values for those bits depends on the values of pins/fuses during reset sequence, hence the question mark on their default value.

Address: 400F\_8000h base + 1Ch offset = 400F\_801Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R				0			BMOD[1:0]					0

**SRC\_SBMR2 field descriptions**

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 BMOD[1:0]	BMOD[1:0] shows the latched state of the BOOT_MODE1 and BOOT_MODE0 signals on the rising edge of POR_B. See the Boot mode pin settings section of System Boot.
23–5 Reserved	This read-only field is reserved and always has the value 0.
4 BT_FUSE_SEL	BT_FUSE_SEL (connected to gpio bt_fuse_sel) shows the state of the BT_FUSE_SEL fuse. See Fusemap for additional information on this fuse.
3 - 3 - 2 Reserved	Reserved
SEC_CONFIG[1:0]	SECONFIG[1] shows the state of the SECONFIG[1] fuse. See Fusemap for additional information on this fuse. SECONFIG[0] shows the state of the SECONFIG[0] fuse. This fuse is shown as reserved in Fusemap (address 0x440[1]) because it does not have a user-relevant function.

**21.6.5 SRC General Purpose Register 1 (SRC\_GPR1)****NOTE**

This register is used by the ROM code and should not be used by application software.

Address: 400F\_8000h base + 20h offset = 400F\_8020h

### SRC\_GPR10 field descriptions

Field	Description
31 -	Read/write bit, for general purpose <b>NOTE:</b> Reset only by POR
30 PERSIST_SECONDARY_BOOT	This bit identifies which image must be used - primary and secondary. Used only for eMMC/SD/FlexSPI NOR boot.
29–28 -	Read/write bits, for general purpose <b>NOTE:</b> Reset only by POR
27–26 PERSIST_REDUNDANT_BOOT	This field identifies which image must be used - 0/1/2/3. Used for both SPI NAND and SLC raw NAND devices.

Table continues on the next page...

**SRC\_GPR10 field descriptions (continued)**

Field	Description
25 -	This field is reserved. Reserved.
-	Read/write bits, for general purpose <b>NOTE:</b> Reset only by POR

# Chapter 22

## Fusemap

### 22.1 Boot Fusemap

This section describes the various modes and the selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by the BOOT\_CFG1[7:4] fuses.

**Table 22-1. Boot device select**

Boot Device	BOOT_CFG1[7]	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]
FlexSPI1 (Serial NOR)	0	0	0	0
SD	0	1	x	x
MMC/eMMC	1	0	x	x
SEMC (NAND)	0	0	1	x
SEMC (NOR)	0	0	0	1
FlexSPI1 (Serial NAND)	1	1	x	x

### NOTE

The fuses marked as “Reserved” are reserved for NXP internal (and future) use only, or are security related. Customers **must NOT** attempt to burn these, because the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

Security-related fuses are described in the Security Reference Manual (SRM) for this device.

**Table 22-2. FlexSPI (Serial NOR) boot fusemap**

#### NOTE

Security-related fuses are shown as reserved here. For details, refer to the Security Reference Manual.

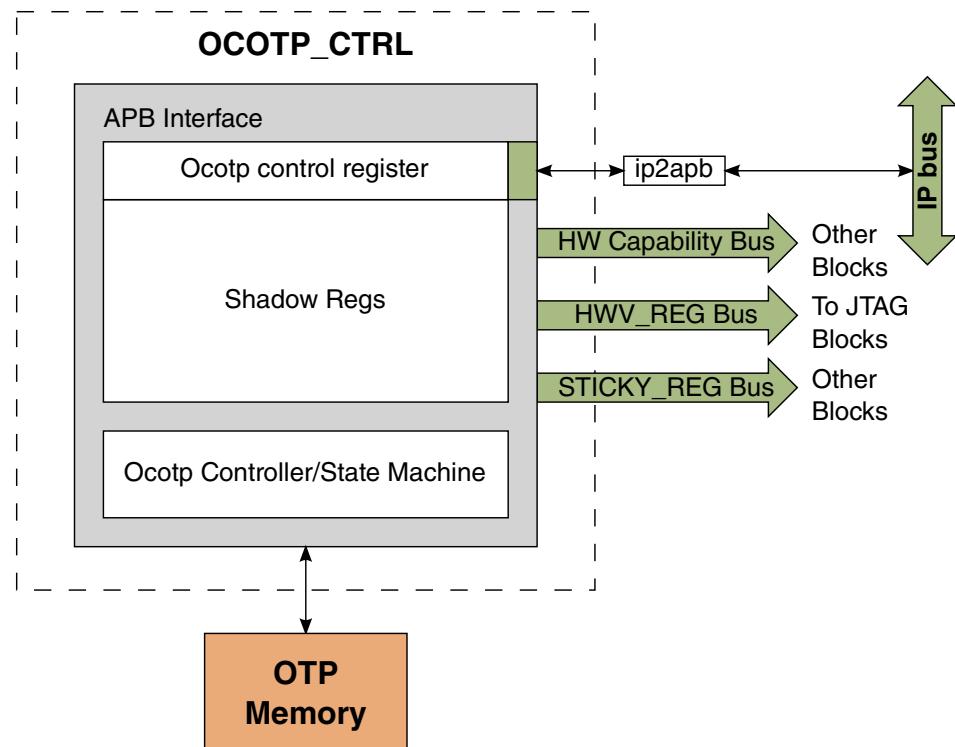

### 23.2 Overview

This section contains information describing the On-Chip OTP controller (OCOTP\_CTRL) along with details about the block functionality and implementation.

In this document, the words "eFuse" and "OTP" are interchangeable. OCOTP refers to the hardware block itself.

## 23.2.1 Block Diagram

The system level block diagram for OCOTP is provided below.

**Figure 23-1. OCOTP System Level Block Diagram**

## 23.2.2 Features

The OCOTP provides the following features :

- 32-bit word restricted program and read to 2 kbit (128 x 8) of eFuse.
- Loading and housing of eFuse content into shadow registers
- Memory-mapped (restricted) access to shadow registers
- Provides program-protect and read-protect of eFuse
- Provides override and read protection of shadow register

## 23.3 Functional Description

## 23.3.1 Operations

The IP bus interface of the OCOTP has the following functions.

- Configure control registers for programming and reading all the fuse words
- Override and read shadow registers

OCOTP configuration for programs and reads are performed on 32-bit words for software (SW) convenience. For writes, the 32-bit word reflects the "write-mask". Bit fields with 0 will not be programmed and bit fields with 1 will be programmed. OCOTP will program bit field with 1 in the fuse word one bit by one bit. For reads, OCOTP will read 4 times to get 4 bytes in the fuse word in order.

In this document, 2 kbit fuse are divided into 8 banks by function. Each bank has 8 fuse words. Physically, 2 kbits fuse are in two 128x8 efusebox.

### 23.3.1.1 Shadow Register Reload

All fuse words in efuse box are shadowed. This means that at reset, fuse values are read and then copied into memory-mapped shadow registers. If fuses are subsequently programmed, the shadow registers should be reloaded to keep them coherent with the fuse bank arrays.

The "reload shadows" feature allows the user to force a reload of the shadow registers without having to reset the device. To force a reload, complete the following steps:

1. Set the TIMING[STROBE\_READ] field value appropriately.
2. Set the TIMING[RELAX] field value appropriately.
3. Check that CTRL[BUSY] and CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read, or reload must be completed before a new access can be requested.
4. Set the CTRL[RELOAD\_SHADOWS] bit. OCOTP will read all the fuses one by one and put it into corresponding shadow register.
5. Wait for CTRL[BUSY] and CTRL[RELOAD\_SHADOWS] to be cleared by the controller.

The controller will automatically clear the CTRL[RELOAD\_SHADOWS] bit after the successful completion of the operation.

### 23.3.1.2 Fuse and Shadow Register Read

All shadow registers are always readable through the IPS bus. When their corresponding fuse lock bits are set, the shadow registers also become read locked. After read locking, reading from these registers will return 0xBADABADA.

In addition, CTRL[ERROR] will be set. It must be cleared by software before any new write, read, or reload access can be issued. Subsequent reads to unlocked shadow registers will still work successfully.

To read fuse words directly from the fusebox instead of the shadow registers, complete the following steps:

1. Program TIMING[STROBE\_READ] and TIMING[RELAX] fields with timing values to match the current frequency of the ipg\_clk. OTP read will work at maximum bus frequencies as long as the TIMING parameters are set correctly.
2. Check that CTRL[BUSY] and CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read, or reload must be completed before a read access can be requested.
3. Write the requested fuse address to CTRL[ADDR].
4. Set READ\_CTRL[READ\_FUSE] to start the read operation.
5. Wait for the controller to clear CTRL[BUSY]. A read request to a protected or locked region will result in no OTP access and no setting of CTRL[BUSY]. In addition, CTRL[ERROR] will be set. It must be cleared by software before any new access can be issued.
6. Read READ\_FUSE\_DATA to get fuse word value. READ\_FUSE\_DATA will be 0xBADABADA when CTRL[ERROR] is set.

### 23.3.1.3 Fuse and Shadow Register Writes

Shadow register bits can be overridden by software until the corresponding fuse lock bit for the region is set. When the lock shadow bit is set, the shadow registers for that lock region become write locked. The LOCKn register also has no overwrite or fuse lock bits, but it is always read-only.

In order to avoid "rogue" code performing erroneous writes to OTP, a special unlocking sequence is required for writes to the fuse banks. To program fuse bank complete the following steps:

1. Program the following fields with timing values to match the frequency of ipg\_clk:
  - TIMING[STROBE\_PROG]
  - TIMING[RELAX]

OTP writes will work at maximum bus frequencies as long as the TIMING parameters are set correctly.

2. Check that CTRL[BUSY] and CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read, or reload must be completed before a write access can be requested.
3. Write the requested address to CTRL[ADDR] and program the unlock code into CTRL[WR\_UNLOCK]. The unlock code must be programmed for each write access. The unlock code is documented in the register description. Both the unlock code and address can be written in the same operation.
4. Write the data to the DATA register. This will automatically set CTRL[BUSY] and clear CTRL[WR\_UNLOCK]. Bit fields with 1's will result in that OTP bit being programmed. Bit fields with 0's will be ignored. At the same time that the write is accepted, the controller makes an internal copy of CTRL[ADDR] which cannot be updated until the next write sequence is initiated. This copy guarantees that erroneous writes to CTRL[ADDR] will not affect an active write operation. During the write operation, DATA cannot be modified.
5. Wait for the controller to clear CTRL[BUSY]. A write request to a protected or locked region will result in no OTP access and no setting of CTRL[BUSY]. In addition CTRL[ERROR] will be set. It must be cleared by software before any new write access can be issued.

It should be noted that write latencies to OTP are numbers of 10 micro-seconds per word. The write latency is based on the number of "1" bits being written. For example, to program half the fuse bits in one 32-bit word requires 10 us x 16.

### 23.3.1.4 Error Conditions

The CTRL[ERROR] bit will be set under the following conditions:

- A write is performed to a shadow register during a shadow reload (CTRL[RELOAD\_SHADOWS] is set). In addition, the contents of the shadow register shall not be updated.
- A write is performed to a shadow register which has been locked.
- A read is performed to a shadow register which has been read locked.
- A program is performed to a fuse word which has been locked.
- A read is performed to a fuse word which has been read locked.
- Overlapping access - a read, write, or reload is attempted while a read, write, or reload is already in progress.

### 23.3.1.5 Write Postamble

Due to internal electrical characteristics of the OTP during writes, all OTP operations (direct reads, shadow reloads, or other writes) following a write must wait at least 2  $\mu$ s after CTRL[BUSY] clears. The delay guarantees programming voltages on-chip reach a steady state when exiting a write sequence.

A recommended software sequence to meet the postamble requirements is as follows:

1. Issue the write and poll for CTRL[BUSY].
2. After CTRL[BUSY] is clear, wait 2  $\mu$ s.
3. Perform the next OTP operation.

### 23.3.2 Fuse Shadow Memory Footprint

The OTP memory footprint is shown in the following figure. The registers are grouped by lock region. Their names correspond to the fusemap names.

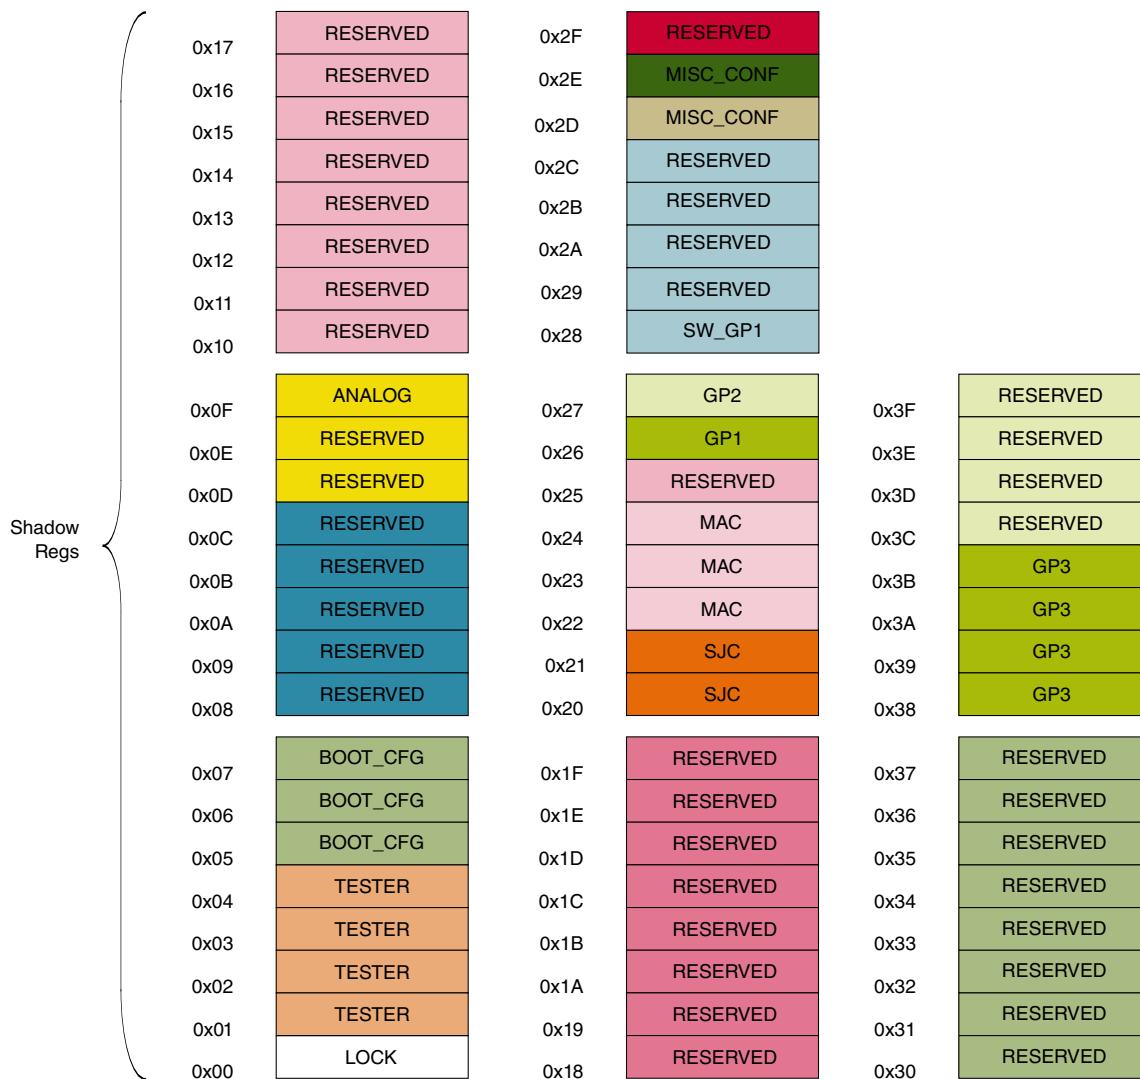

Figure 23-2. OTP Memory Footprint

### 23.3.3 OTP Read/Write Timing Parameters

The timing fields contained in the HW\_OCOTP\_TIMING register that specify counter limit values, which are used to time how long the state machine remains in the various states, as well as specify the STROBE signal timing.

The timing parameters are specified in ipg\_clk cycles. Since the ipg\_clk frequency can be set to a range of values, these parameters must be adjusted with the clock to yield the appropriate delay.

Register Field	Description
----------------	-------------

*Table continues on the next page...*

## Functional Description

HW_OCOTP_TIMING[WAIT]	"WAIT" specifies time interval between auto read and write access in one time program. $t_{SP\_RD} = (WAIT+1)/ipg\_clk\_freq$ , should be $\geq 150$ ns.
HW_OCOTP_TIMING[RELAX]	"RELAX" is used to configure the setup/hold time for certain timing margin. $t_{SP\_PGM} = t_{HP\_PGM} = (RELAX+1)/ipg\_clk\_freq$ , should be $\geq 100$ ns.
HW_OCOTP_TIMING[STROBE_PROG]	$t_{PGM} = [(STROBE\_PROG+1) - 2 \times (RELAX\_PROG+1)]/ipg\_clk\_freq$ . The $t_{PGM}$ should be configured within the range of 9000 ns < $t_{PGM} < 11000$ ns, while its recommended value is 10000 ns.
HW_OCOTP_TIMING[STROBE_READ]	$t_{RD} = [(STROBE\_READ+1) - 2 \times (RELAX\_READ+1)]/ipg\_clk\_freq$ . The $t_{RD}$ is required to be larger than 45 ns. $t_{AEN} = (STROBE\_READ+1)/ipg\_clk\_freq$ . The $t_{AEN}$ is required to be larger than 75 ns.
HW_OCOTP_TIMING2[RELAX_READ]	"RELAX_READ" is used to configure the setup/hold time for certain timing margin. $(RELAX\_READ+1)/ipg\_clk\_freq$ should be $\geq 10$ ns.
HW_OCOTP_TIMING2[RELAX_PROG]	"RELAX_PROG" is used to configure the setup/hold time for certain timing margin. $(t_{AEN} - t_{PGM})/2 = (RELAX\_PROG+1)/ipg\_clk\_freq$ , should be $\geq 950$ ns.

### 23.3.4 Resets

The OCOTP is always active. The shadow registers automatically load the appropriate OTP contents after reset is deasserted. During this load-time CTRL[BUSY] is set.

### 23.3.5 Clocks

The table found here describes the clock sources for OCOTP. Please see the chip-specific clocking section for clock setting, configuration and gating information.

**Table 23-2. OCOTP Clocks**

Clock name	Description
ipg_clk	Peripheral clock
ipg_clk_s	Peripheral access clock

## 23.4 External Signals

There are no external signals pinned out for OCOTP.

## 23.5 Fuse Map

See the Fusemap chapter of this reference manual for more information.

## 23.6 Memory Map/Register Definition

The OCOTP Memory Map/Register Definition can be found here.

### NOTE

Writing or reading an unimplemented register address in the OCOTP Controller will not send a bus error and read data will be 0.

### 23.6.1 OCOTP register descriptions

OCOTP Hardware Register Format Summary

## 23.6.1.2 OTP Controller Control and Status Register (CTRL)

### 23.6.1.2.1 Offset

Register	Offset	Description
CTRL	0h	OTP Controller Control and Status Register
CTRL_SET	4h	Writing a 1 to a bit in this register sets the corresponding bit in CTRL
CTRL_CLR	8h	Writing a 1 to a bit in this register clears the corresponding bit in CTRL
CTRL_TOG	Ch	Writing a 1 to a bit in this register toggles the corresponding bit in CTRL

### 23.6.1.2.2 Function

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR\_UNLOCK, ADDR, BUSY and ERROR may be used in conjunction with the DATA register to perform write operations. Read operations to the On-Chip OTP involve ADDR, BUSY and ERROR bit fields and the READ\_CTRL register. The read value is saved in the READ\_FUSE\_DATA register.

### 23.6.1.2.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved					RELOAD_SHADOWS		ERRO_R	BUS_Y	Reserved						
W			Reserved											ADDR		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 23.6.1.2.4 Fields

Field	Function
31-16 WR_UNLOCK	Write Unlock  Write 0x3E77 to enable OTP write accesses. NOTE: This register must be unlocked on a write-by-write basis (a write is initiated when DATA is written), so the UNLOCK bitfield must contain the correct key value during all writes to DATA, otherwise a write shall not be initiated. This field is automatically cleared after a successful write completion (clearing of BUSY).  Values not listed are reserved.  0000000000000000b - OTP write access is locked. 001111001110111b - OTP write access is unlocked.
15-13 —	Reserved
12-11 —	Reserved
10 RELOAD_SHAD_OWS	Reload Shadow Registers  This bit can be set to force re-loading of the shadow registers. This operation will automatically set BUSY. After the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.  0b - Do not force shadow register re-load. 1b - Force shadow register re-load. This bit is cleared automatically after shadow registers are re-loaded.
9 ERROR	Locked Region Access Error  This bit is set by the controller when an access to a locked region (OTP or shadow register) is requested. Reset this bit by writing a one to the CTRL_CLR[ERROR] bit and not by writing to the CTRL register.  0b - No error. 1b - Error - access to a locked region requested.

Table continues on the next page...

Field	Function
8 BUSY	<p>OTP controller status bit</p> <p>This bit is automatically set by the controller when a write or read access to the OTP is started. When set, no new write access or read access to OTP (including RELOAD_SHADOWS) can be performed. This bit is cleared by the controller when an access completes. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.</p> <p>0b - No write or read access to OTP started. 1b - Write or read access to OTP started.</p>
7-6 —	Reserved
5-0 ADDR	<p>OTP write and read access address register</p> <p>Specifies one of 128 word address locations (0x00 - 0x3F).</p>

### 23.6.1.3 OTP Controller Timing Register (TIMING)

#### 23.6.1.3.1 Offset

Register	Offset
TIMING	10h

#### 23.6.1.3.2 Function

The OCOTP Data Register is used for OTP Programming

This register specifies timing parameters for programming and reading the OTP fuse array.

See [OTP Read/Write Timing Parameters](#) for more details.

## Memory Map/Register Definition

### 23.6.1.3.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16	
R	0				WAIT					STROBE_READ								
W																		
Reset	0	0	0	0	1	1	0	0		0	0	0	0	1	1	0	1	
Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0	
R	RELAX				STROBE_PROG													
W	1	0	0	1	0	1	1	1		0	1	0	1	0	1	0	1	

### 23.6.1.3.4 Fields

Field	Function
31-28	Reserved
—	
27-22	Wait Interval
WAIT	This count value specifies the time interval between auto read and write access in one time program to the OTP. It is given in number of ipg_clk periods.  The OTP controller performs a read action before each program action. This is the "auto" read. The purpose of the auto read is to avoid multiple programming to the same bits.
21-16	Read Strobe Period
STROBE_READ	This count value specifies the strobe period in one time read OTP (Trd). Trd = ((STROBE_READ+1)-2*(RELAX_READ+1)) /ipg_clk_freq. It is given in number of ipg_clk periods.
15-12	Relax Count Value
RELAX	This count value specifies the time to add to all default timing parameters other than the Tpgm and Trd. It is given in number of ipg_clk periods.
11-0	Write Strobe Period
STROBE_PROG	This count value controls the strobe period in one time to write OTP (Tpgm). Tpgm = ((STROBE_PROG+1)- 2*(RELAX_PROG+1)) /ipg_clk_freq. It is given in number of ipg_clk periods.

## 23.6.1.4 OTP Controller Write Data Register (DATA)

### 23.6.1.4.1 Offset

Register	Offset
DATA	20h

### 23.6.1.4.2 Function

This register is used in conjunction with the CTRL register to perform one-time writes to the OTP. See the [Fuse and Shadow Register Writes](#) section for operating details.

### 23.6.1.4.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

R	Reserved															READ_FUSE
W																E
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 23.6.1.5.4 Fields

Field	Function
31-1	Reserved
—	
0	READ_FUSE
READ_FUSE	Used to initiate a read from OTP. See the <a href="#">Fuse and Shadow Register Read</a> section for operating details.

## 23.6.1.6 OTP Controller Read Data Register (READ\_FUSE\_DATA)

### 23.6.1.6.1 Offset

Register	Offset
READ_FUSE_DATA	40h

### 23.6.1.6.2 Function

The data read from OTP.

### 23.6.1.6.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DATA															
W

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DATA															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 23.6.1.6.4 Fields

Field	Function
31-0 DATA	The data read from OTP. See the <a href="#">Fuse and Shadow Register Read</a> section for operating details.

## 23.6.1.7 Software Controllable Signals Register (SCS)

### 23.6.1.7.1 Offset

Register	Offset	Description
SCS	60h	Software Controllable Signals Register
SCS_SET	64h	Writing a 1 to a bit in this register sets the corresponding bit in SCS
SCS_CLR	68h	Writing a 1 to a bit in this register clears the corresponding bit in SCS
SCS_TOG	6Ch	Writing a 1 to a bit in this register toggles the corresponding bit in SCS

### 23.6.1.7.2 Function

This register holds volatile configuration values that can be set and locked by software.

## Memory Map/Register Definition

### 23.6.1.7.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	LOCK		SPAR	E													
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R																	
W	SPAR	E															HAB_JD
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

### 23.6.1.7.4 Fields

Field	Function
31 LOCK	Lock  This bitfield locks the bits in this register.  0b - Bits in this register are unlocked. 1b - Bits in this register are locked. When set, all of the bits in this register are locked and can not be changed through SW programming. After this bit is set, it can only be cleared by a POR.
30-1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable  This bit can be used by the High Assurance Boot (HAB) portion of the Boot ROM to enable JTAG debugging, assuming that a properly signed command to do so is found and validated by the HAB. The HAB will lock the register before passing control to the application whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it cannot be disabled unless the system is reset by POR.  0b - JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1b - JTAG debugging is enabled by the HAB (though this signal may be gated off).

### 23.6.1.8 OTP Controller Version Register (VERSION)

#### 23.6.1.8.1 Offset

Register	Offset
VERSION	90h

### 23.6.1.8.2 Function

This register indicates the RTL version in use.

### 23.6.1.8.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 23.6.1.10.4 Fields

Field	Function
31	Reserved
—	
30-28	Reserved
—	
27-26	GP3 Write Lock Status
GP3	Status of shadow register and OTP write lock for GP3 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
25-24	Reserved
—	
23	Reserved
—	
22	MISC_CONF Write Lock Status
MISC_CONF	Status of shadow register and OTP write lock for misc_conf region. 0b - Writing of this region's shadow register and OTP fuse word are not blocked. 1b - When set, the writing of this region's shadow register and OTP fuse word are blocked.
21	Reserved
—	

Table continues on the next page...

## Memory Map/Register Definition

Field	Function
20 —	Reserved
19-18 ANALOG	ANALOG Write Lock Status Status of shadow register and OTP write lock for analog region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
17 —	Reserved
16 SW_GP1	SW_GP1 Write Lock Status Status of shadow register and OTP write lock for sw_gp1 region. 0b - Writing of this region's shadow register and OTP fuse word are not blocked. 1b - When set, the writing of this region's shadow register and OTP fuse word are blocked.
15 —	Reserved
14 —	Reserved
13-12 GP2	GP2 Write Lock Status Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
11-10 GP1	GP1 Write Lock Status Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
9-8 MAC_ADDR	MAC_ADDR Write Lock Status Status of shadow register and OTP write lock for mac_addr region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
7 —	Reserved
6 SJC_RESP	SJC_RESP Lock Status Status of shadow register read and write, OTP read and write lock for sjc_resp region. 0b - The writing or reading of this region's shadow register and OTP fuse word are not blocked. 1b - When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked
5-4 —	Reserved
3-2 BOOT_CFG	BOOT_CFG Write Lock Status Status of shadow register and OTP write lock for boot_cfg region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
1-0 —	Reserved

### 23.6.1.11 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (CFG0)

#### 23.6.1.11.1 Offset

Register	Offset
CFG0	410h

#### 23.6.1.11.2 Function

Shadowed memory mapped access to OTP Bank 0, word 1 (ADDR = 0x01).

Copied from the OTP automatically after reset. Can be re-loaded by setting CTRL[RELOAD\_SHADOWS]

#### 23.6.1.11.3 Diagram

31-0 BITS	This register reflects the value of OTP Bank 7, word 3 (ADDR = 0x3B). See the Fusemap Descriptions Table in the Fusemap chapter for more fuse details.

# Chapter 24

## External Memory Controllers

### 24.1 Overview

This chip has these external memory interfaces and controllers:

- Smart External Memory Controller (SEMC)
- eSD/eMMC/SDIO Interface
- Flexible Serial Peripheral Interface (FlexSPI)

### 24.2 Smart External Memory Controller (SEMC) Overview

The SEMC is a multi-standard memory controller optimized for both high-performance and low pin-count. It can support multiple external memories in the same application with shared address and data pins. The interface supported includes SDRAM, NOR Flash, SRAM and NAND Flash, as well as 8080 display interface.

The key features of the SEMC include:

- Support up to 8 memory regions up to 512Mbit per region which can be configured to be memory space of SDRAM, NOR Flash, NAND Flash, SRAM or 8080 display frame buffer
- Chip Select (CS) signals
- Ability to disable SDRAM and NAND controller by separate fuse bit
- Support Address Latch Enable (ALE)
- SDRAM interface
  - Supports both 8-bit, 16-bit modes
  - Up to 512Mb per each Chip Select (CS) and up to 4x CS
- NOR Flash and SRAM interface
  - Supports both 8-bit and 16-bit modes
  - Asynchronous mode
  - Address and Data Multiplexing (ADM)
  - Support NOR Flash program via IPBus configuration

- 8080 display interface
  - Supports both 8/16/24-bit modes
  - Up to 100MHz
  - Without tearing effect support
- NAND Flash
  - 8/16-bit NAND FLASH
  - Asynchronous mode
  - Only supports device which is capable of cache read/write operations
  - Only supports page based operation
- Dynamic I/O sharing which enables multiple external memory device in parallel
- Multi-device access pattern scheduler
  - 8 entries scheduler
  - QoS priority, latency and efficiency adjustable arbitration scheme
- SDRAM access pattern optimization
  - 8 entries command reordering queue
  - QoS priority, latency and efficiency adjustable arbitration scheme

## 24.3 eMMC/eSD/SDIO

This chip has two Ultra Secured Digital Host Controller (uSDHC) modules for SD/eMMC interface. It provides the interface between the host system and the SD/SDIO/MMC cards.

The key features include:

- Support SD/SDIO standard, up to version 3.0
- Support MMC standard, up to version 4.5
- Support 3.3V and 1.8V operation, but do not support 1.2V operation.
- Supports 1-bit / 4-bit SD and SDIO modes, 1-bit / 4-bit / 8-bit MMC modes
  - Up to 800 Mbps of data transfer for SDIO cards using 4 parallel data lines in SDR mode
  - Up to 400 Mbps of data transfer for SDIO card using 4 parallel data lines in DDR mode
  - Up to 800 Mbps of data transfer for SDXC cards using 4 parallel data lines in SDR mode
  - Up to 400 Mbps of data transfer for SDXC card using 4 parallel data lines in DDR mode
  - Up to 1600 Mbps of data transfer for MMC cards using 8 parallel data lines in SDR mode
  - Up to 800 Mbps of data transfer for MMC cards using 8 parallel data lines in DDR mode

## 24.4 Quad Serial Peripheral Interface

This chip has one Quad Serial Peripheral Interface block (named FlexSPI) acts as an interface to one or two external serial flash devices, each with up to four bidirectional data lines.

The key features includes:

- Each channel can be configured as 1/2/4-bit operation
- Support both dual-channel or single-channel operation
- Support both SDR mode and DDR mode
- Support up to 166 MHz SDR Mode and 166 MHz DDR Mode (with external Flash device DQS input)
- Support up to 133 MHz SDR Mode and 66 MHz DDR Mode (with internal DQS loopback mode)

# Chapter 25

## Smart External Memory Controller (SEMC)

### 25.1 Chip-specific SEMC information

#### NOTE

- For SEMC\_CLKX0, see SEMC\_CLK5 in IOMUXC chapter.
- For SEMC\_CLKX1, see SEMC\_CLK6 in IOMUXC chapter.

### 25.2 Overview

The SEMC is a multi-standard memory controller optimized for both high-performance and low pin-count. It can support multiple external memories in the same application with shared address and data pins. The interfaces supported include SDRAM, NOR Flash, SRAM, NAND Flash, and 8080 display interface.

## 25.2.1 Block Diagram

**Figure 25-1. SEMC Block Diagram**

## 25.2.2 Features

The SEMC includes the following features:

- Memory space:
  - Supports 9 memory regions:
    - Region #0 for SDRAM CS0 device
    - Region #1 for SDRAM CS1 device
    - Region #2 for SDRAM CS2 device
    - Region #3 for SDRAM CS3 device
    - Region #4 and #8 for NAND device (IP command and AXI command use different region to avoid large region address range on AXI interface)
    - Region #5 for NOR device
    - Region #6 for SRAM device
    - Region #7 for 8080 display frame buffer
  - Each region is configurable for base address, memory size and valid bit
- AXI slave interface
  - Supports 16 outstanding transfers (total including both reads and writes)
    - Supports 8 outstanding write transfers
    - Supports 16 outstanding read transfers
  - Multi-device access pattern optimization with Queue A
    - 8 entries command reordering in Queue A
    - Adjustable arbitration scheme based on QoS priority, latency and efficiency
  - SDRAM access pattern optimization with Queue B

- 8 entries command reordering in Queue B
- Adjustable arbitration scheme based on QoS priority, latency and efficiency
- Memory-mapped AXI interface for read and write access
- Supports 32/16/8 bit access
- IP Bus interface
  - Internal configuration register access
  - Trigger device access such as device initialization/configuration/read/write (IP command)
- SDRAM interface
  - Supports 8/16 bit modes
  - Supports 4 Chip Select (CS) and each CS up to 512Mb
- NAND Flash interface
  - Supports 8/16 bit modes
  - No hardware ECC
  - Supports device which is capable of cache read/write operations
  - Supports page based read/write operation
  - Supports 32 bit transfer size for AXI write operation
- NOR Flash interface
  - Supports 16 bit mode
  - Supports ADMUX and AADM modes
  - NOR Flash write access is supported only by IP command
  - Up to 512Mb memory size

#### **NOTE**

- Up to 512Mb memory size if SEMC\_ADDR08 is used as address
- Up to 256Mb memory size if SEMC\_ADDR08 is used as chip select
- SRAM interface
  - Supports SRAM and Pseudo SRAM
  - Supports 16 bit mode
  - Supports ADMUX and AADM modes
  - Up to 512Mb memory size

#### **NOTE**

- Up to 512Mb memory size if SEMC\_ADDR08 is used as address
- Up to 256Mb memory size if SEMC\_ADDR08 is used as chip select
- 8080 display interface

- Supports 8/16 bit modes
- No tearing effect support
- Misc
  - Dynamic I/O sharing which enables multiple external memory device in parallel
  - Up to 7 Chip Select (CS) signals
  - Supports Address Latch Enable (ALE) for SRAM/NOR device

## 25.3 Functional Description

The following sections describe functional details of the SEMC module.

### 25.3.1 Operations

The following sections describe operations of the SEMC module.

#### 25.3.1.1 Modes of Operation

The SEMC supports the following operation modes:

- Module Disable mode

In module disable mode, the internal clock is gated for low power, but access to configuration and status registers is available.

This mode is entered by setting MCR[MDIS], and exited by clearing MCR[MDIS]. Software should poll STS0[IDLE] to make sure there are no pending transactions before entering module disable mode.

- Stop mode

When the system requires the SEMC to enter stop mode, the SEMC waits for all transactions to complete (STS0[IDLE]=1) and returns acknowledge handshake to system. The system can gate off the SEMC clock after the stop acknowledge handshake is returned. There is no clock gating within the SEMC module.

The SEMC exits this mode immediately when the system stop mode request is negated.

- Normal mode

Access to external devices and internal registers are available in normal mode. The SEMC clock is not gated internally.

### 25.3.1.2 Device Access by AXI Command

Devices can be accessed by AXI bus access directly. AXI command is the device access sequence triggered by AXI bus access. The device access sequence for AXI commands is described in the following sections.

#### NOTE

- The AXI bus memory map for each device is defined by Base Registers.
- There is no software configuration or polling needed for AXI command.
- AXI command is the first choice to access device memory. IP command is suitable for other access, such as device register/OTP space access, device initialization, etc.
- IP command can be used to access memory like AXI command, but it is not recommended if AXI command is available. IP command access is low efficiency.

#### 25.3.1.2.1 Bus Master Control Registers (BMCRn) Configuration

BMCRn can be used to balance external memory access efficiency, urgency and latency based on the requirements of a specific application.

##### 25.3.1.2.1.1 BMCR0 Registers Configuration

For Queue A controlled by BMCR0, the arbitration logic adopts a weight based algorithm that assigns each command in the reordering queue with a final score.

The arbitration logic calculates a SCORE for each command based on the formula below, where the weighting factor for each parameter is controlled by the BMCR0 configuration. The command with the highest SCORE is served first.

$$\text{SCORE} = \text{QOS} * \text{WQOS} + \text{AGE} * \text{WAGE}/4 + \text{WSH} + \text{WRWS}$$

1. QOS stands for AxQOS of AXI bus, and WQOS is the weight factor of QOS.
2. AGE stands for the wait period for each command in queue, and WAGE is the weight factor of AGE.
3. WSH stands for weight of slave hit without read/write switch scenario.
4. WRWS stands for weight of slave hit with read/write switch scenario.

Recommend to set BMCR0 with 0x0 for applications that require restrict sequence of transactions, such as stack is allocated in SDRAM. The write and read transactions to the same address might be reordered if transactions in the queue is reordered, and it might crash the routine. WQOS can be non-zero value if needed, meanwhile WAGE must be non-zero value as well. Anyway, WRWS and WSH should be 0x0.

### **25.3.1.2.1.2 BMCR1 Registers Configuration**

For Queue B controlled by BMCR1, the arbitration logic adopts a weight based algorithm that assigns each command in the reordering queue with a final score.

The arbitration logic calculates SCORE for each SDRAM command based on the formula below. The command with the highest SCORE is served first.

$$\text{SCORE} = \text{QOS} * \text{WQOS} + \text{AGE} * \text{WAGE}/4 + \text{WPH} + \text{WBR} + \text{WRWS}$$

1. QOS stands for AxQOS of AXI bus, and WQOS is the weight factor of QOS.
2. AGE stands for the wait period for each command in queue, and WAGE is the weight factor of AGE.
3. WPH stands for weight of page hit scenario.
4. WBR stands for weight of bank rotation/switch scenario.
5. WRWS stands for weight of slave hit without read/write switch scenario.

Recommend to set BMCR1 with 0x0 for applications that require restrict sequence of transactions, such as stack is allocated in SDRAM. The write and read transactions to the same address might be reordered if transactions in the queue is reordered, and it might crash the routine. WQOS can be non-zero value if needed, meanwhile WAGE must be non-zero value as well. Anyway, WRWS and WSH should be 0x0.

### **25.3.1.3 Device Access by IP Command**

Devices can be accessed (initialized/configured/read/written) by IP bus access also. IP command is the device access sequence triggered by IP bus access. The device access sequence for IP command is described in the following sections.

Device access can be triggered by IP command using the following steps:

1. Set IPCR0/IPCR1/IPCR2/IPTXDAT registers for device address, data size, write mask and write data.
2. Set IPCMD register with valid command code (IPCMD[CMD]) and command key (IPCMD[KEY]).
3. Wait for IP command done (INTR[IPCMDDONE] sets).
4. Read the device data from IPRXDAT register. This is for read access only.

**NOTE**

- If device address or command code setting is not valid, an IP command error interrupt is generated (INTR[IPCMDERR]) and no device access occurs.
- If another IP command is triggered when the previous IP command has not finished yet, an IP command error interrupt is generated.
- IPCR0/IPCR1/IPCR2/IPTXDAT registers are protected when an IP command is in progress. Any write access to these registers is ignored until the IP command completes.
- The IPCR0 slave address field must be configured even if the memory does not require an address for the selected command (such as WRITE ENABLE command). The SEMC determines the slave device by decoding the device address.
- The slave device is limited to NAND when IPCMD[KEY] is 0x5AA5.

### 25.3.1.4 SDRAM Controller Operations

This section describes the operations of SDRAM controller.

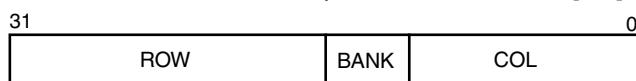

#### 25.3.1.4.1 SDRAM Address Multiplexing

SDRAMs use a multiplexed address split into rows, columns, and banks. [Figure 25-2](#) shows how the bits of the linear address sent to the SEMC are split up into the row, column, and bank addresses sent to the SDRAM memory device.

SDRAM device address map when SDRAMCR0[PS]=1 (16 bit mode)

SDRAM device address map when SDRAMCR0[PS]=0 (8 bit mode)

**Figure 25-2. SDRAM Device Address Multiplexing**

**NOTE**

- SDRAM address consists of row, bank and column address bits.

- Column address bits offset is bit 0 if SDRAMCR0[PS]=0, bit 1 if SDRAMCR0[PS]=1. Column address bit width is determined by SDRAMCR0[COL] and SDRAMCR0[COL8].
- Bank address bits offset is determined by SDRAMCR0[PS], SDRAMCR0[COL] and SDRAMCR0[COL8]. Bank address bit width is determined by SDRAMCR0[BANK2].
- Row address bits offset is determined by SDRAMCR0[PS], SDRAMCR0[COL], SDRAMCR0[COL8] and SDRAMCR0[BANK2]. Row address bit width is determined by external SDRAM device.
- SDRAM device base address on SoC is configured by BR0, BR1, BR2 and BR3 registers.

### 25.3.1.4.2 SDRAM Access by IP Command

[Table 25-2](#) lists the SDRAM access types that are triggered by IP commands.

**Table 25-2. SDRAM IP Command**

Command	Code	Comment
READ	0x8	Reads from the SDRAM memory
WRITE	0x9	Writes to the SDRAM memory
MODE REGISTER SET	0xA	Writes the mode register inside the SDRAM memory
ACTIVE	0xB	Sends a new bank and row address to the memory
AUTO REFRESH	0xC	Auto refresh
SELF REFRESH	0xD	Puts the SDRAM into low power data retention mode. The memory cannot be accessed while in self refresh mode.
PRECHARGE	0xE	Closes the currently active row for the specified bank
PRECHARGE ALL	0xF	Closes the active rows for all banks

#### 25.3.1.4.2.1 READ

When an IP command is triggered with command code - READ, the SEMC will send a READ command to the SDRAM device.

[Figure 25-3](#) shows the sequence for IP command - READ.

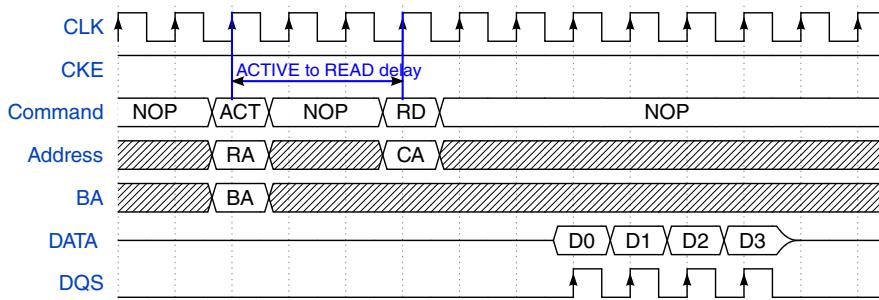

Figure 25-3. IP Command - SDRAM READ

**NOTE**

- It is supported but not recommended to send READ command with IP command trigger. The SEMC should read SDRAM device by AXI command.
- Read address is from IPCR0 register, read data is sent to IPRXDAT register.
- For this example:
  - ACTIVE to READ/WRITE delay is 3 (SDRAMCR1[ACT2RW]=2)

**25.3.1.4.2.2 WRITE**

When an IP command is triggered with command code - WRITE, the SEMC will send a WRITE command to the SDRAM device.

Figure 25-4 shows the sequence for IP command - WRITE.

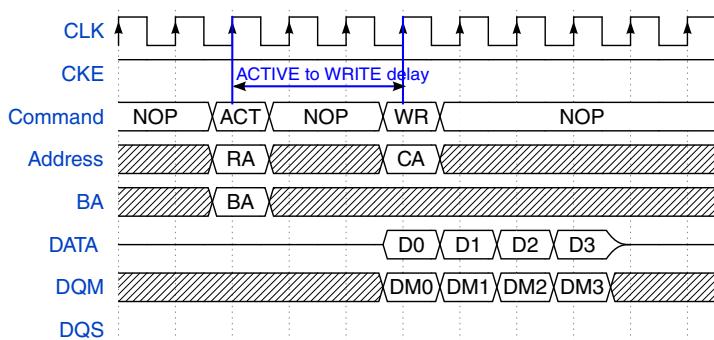

Figure 25-4. IP Command - SDRAM WRITE

**NOTE**

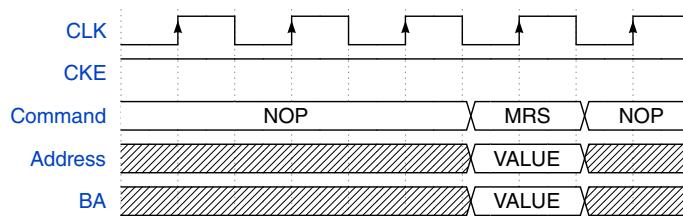

- It is supported but not recommended to send WRITE command with IP command trigger. The SEMC should write SDRAM device by AXI command.

- Write address is from IPCR0 register, write data is from IPTXDAT register, write mask is from IPCR2 register.
- For this example:
  - ACTIVE to READ/WRITE delay is 3 (SDRAMCR1[ACT2RW]=2)

#### 25.3.1.4.2.3 MODE REGISTER SET

When an IP command is triggered with command code - MODE REGISTER SET, the SEMC will send a MODE REGISTER SET command to the SDRAM device.

[Figure 25-5](#) shows the sequence for IP command - MODE REGISTER SET.

**Figure 25-5. IP Command - SDRAM MODE REGISTER SET**

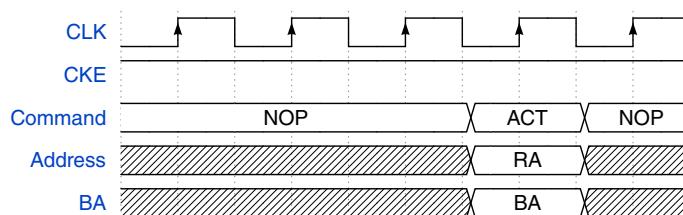

#### NOTE

- MODE REGISTER SET command triggered by IP command should be used for SDRAM device initialization only.
- The "Value" of Address and BA comes from IPTXDAT register.

#### 25.3.1.4.2.4 ACTIVE

When an IP command is triggered with command code - ACTIVE, the SEMC will send an ACTIVE command to the SDRAM device.

[Figure 25-6](#) shows the sequence for IP command - ACTIVE.

**Figure 25-6. IP Command - SDRAM ACTIVE**

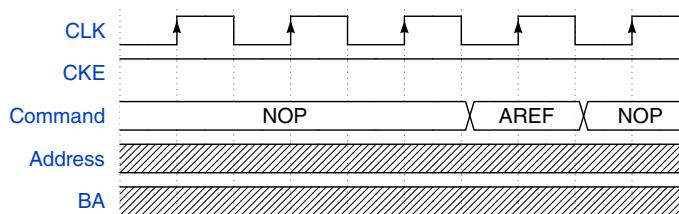

**NOTE**

- It is supported but not recommended to send ACTIVE command with an IP command trigger. The SEMC can handle page management for READ/WRITE/AUTO REFRESH/SELF REFRESH etc.

**25.3.1.4.2.5 AUTO REFRESH**

When an IP command is triggered with command code - AUTO REFRESH, the SEMC will send an AUTO REFRESH command to the SDRAM device.

[Figure 25-7](#) shows the sequence for IP command - AUTO REFRESH.

**Figure 25-7. IP Command - SDRAM AUTO REFRESH**

**NOTE**

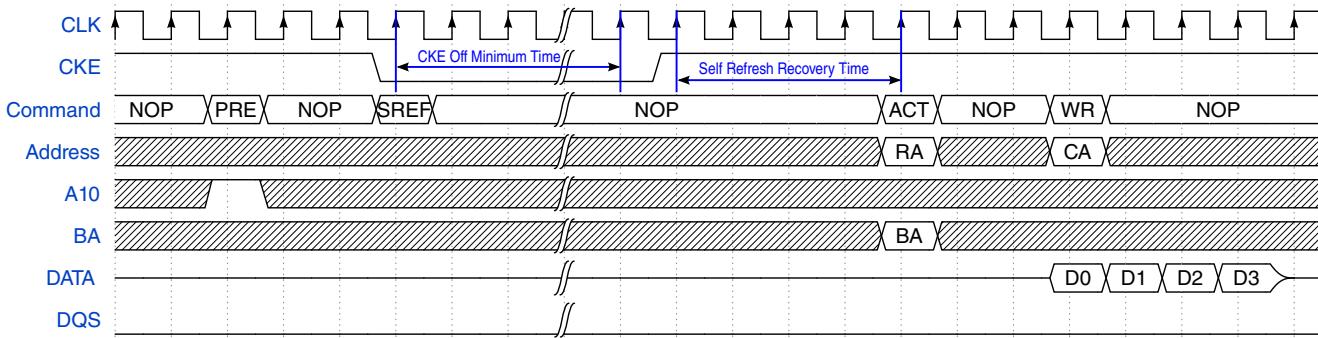

- There is only one AUTO REFRESH command sent when triggered by IP command and only one device is accessed.
- The SEMC sends PRECHARGE ALL command to close any opened page on device before sending AUTO REFRESH command. There is no PRECHARGE ALL command if no pages on the selected device are open.
- AUTO REFRESH command triggered by IP command should be used for SDRAM device initialization only. For entering auto refresh during normal operation, set SDRAMCR3[REN] to 1 and the SEMC will send AUTO REFRESH command automatically.

**25.3.1.4.2.6 SELF REFRESH**

When a SELF REFRESH IP command is requested for any SDRAM device, the SEMC will send a SELF REFRESH command to all SDRAM devices. After the SELF REFRESH command is completed, all SDRAM devices should be in self refresh mode and the SEMC keeps this mode on SDRAM interface (SEMC\_CKE=0 and SEMC\_CLK=0).

The SEMC brings all SDRAM devices out of self refresh mode when there is any new IP command or AXI command triggered to an SDRAM device.

Figure 25-8 shows the sequence for self refresh entering and exiting by AXI command.

**Figure 25-8. IP Command - SDRAM SELF REFRESH**

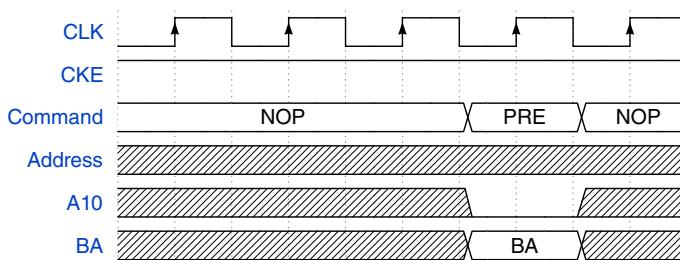

### NOTE

- The SEMC sends PRECHARGE ALL command to close any opened page on device before entering self refresh mode. There is no PRECHARGE ALL command if no page is opened at any device.
- SELF REFRESH command sends to all devices.
- It is not recommended to put device into self refresh mode by IP command triggering although it is supported. Recommend to put device into self refresh mode by the SEMC STOP mode instead.
- Disable the SEMC auto refresh enable bit (SDRAMCR3[REN]=0) before entering self refresh mode, otherwise the SEMC may bring devices out of self refresh mode.
- For this example:
  - Self refresh recovery time is 4 clock cycles (SDRAMCR2[SRRC]=3)
  - CKE off minimum time is 4 clock cycles (SDRAMCR1[CKEOFF]=3)
  - The SEMC brings SDRAM out of self refresh mode when an AXI write command is triggered.

#### 25.3.1.4.2.7 PRECHARGE

When an IP command is triggered with command code - PRECHARGE, The SEMC will send a PRECHARGE command to the SDRAM device.

Figure 25-9 shows the sequence for IP command - PRECHARGE.

**Figure 25-9. IP Command - SDRAM PRECHARGE**

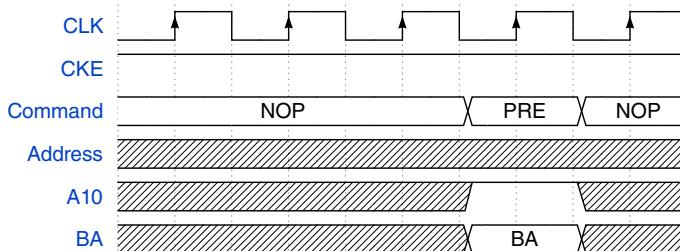

#### NOTE

- It is not recommended to send PRECHARGE command triggered by IP command although it is supported. The SEMC can handle page management for READ/WRITE/AUTO REFRESH/SELF REFRESH etc.

#### 25.3.1.4.2.8 PRECHARGE ALL

When an IP command is triggered with command code - PRECHARGE ALL, the SEMC will send a PRECHARGE ALL command to the SDRAM device.

Figure 25-10 shows the sequence for IP command - PRECHARGE ALL.

**Figure 25-10. IP Command - SDRAM PRECHARGE ALL**

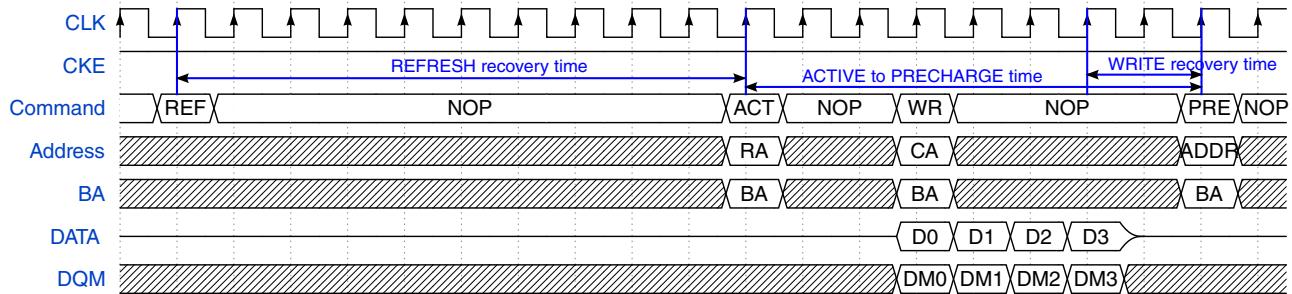

#### NOTE

- It is not recommended to send PRECHARGE ALL command triggered by IP command although it is supported. The SEMC can handle page management for READ/WRITE/AUTO REFRESH/SELF REFRESH etc.
- PRECHARGE ALL command triggered by IP command should be used for SDRAM device initialization only.

#### 25.3.1.4.2.9 Combination of IP Commands

Figure 25-11 shows a combination sequence of IP commands, that includes AUTO REFRESH, ACTIVE, WRITE and PRECHARGE IP commands.

## Functional Description

**Figure 25-11. IP Command - AUTO REFRESH, ACTIVE, WRITE and PRECHARGE**

### NOTE

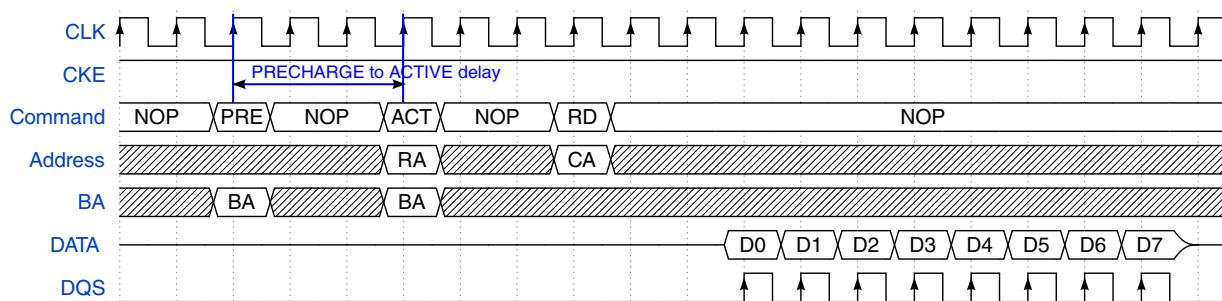

- For this example:
  - REFRESH recovery time is 10 clock cycles (SDRAMCR1[RFRC]=9)
  - WRITE recovery time is 2 clock cycles (SDRAMCR1[WRC]=1)
  - ACTIVE to PRECHARGE minimum time is 6 clock cycles (SDRAMCR1[ACT2PRE]=5). Current ACTIVE to PRECHARGE time is 8 clock cycles by the limitation of WRITE burst beats and recovery time.

### 25.3.1.4.3 SDRAM Device Access by AXI Command

SDRAM device read/write access can be triggered by AXI Command. For AXI read access, the SEMC will send READ commands to SDRAM device automatically and return data on AXI bus. For AXI write access, the SEMC will save AXI bus write data and send WRITE commands to the SDRAM device automatically

#### 25.3.1.4.3.1 Read Access

Figure 25-12 shows an SDRAM read triggered by an AXI command.

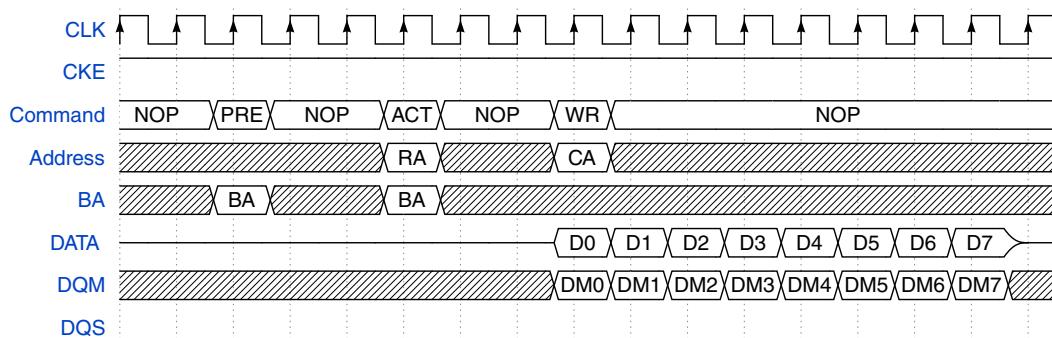

**Figure 25-12. AXI Command - SDRAM READ**

**NOTE**

- The SEMC opens/closes pages automatically for current AXI command.
- For this example:
  - CAS latency is 3 (SDRAMCR0[CL]=3)
  - Burst length is 8 (SDRAMCR0[BL]=3)
  - PRECHARGE to ACTIVE delay is 3 clock cycles (SDRAMCR1[PRE2ACT]=2)

**25.3.1.4.3.2 Write Access**

Figure 25-13 shows an SDRAM write triggered by an AXI command.

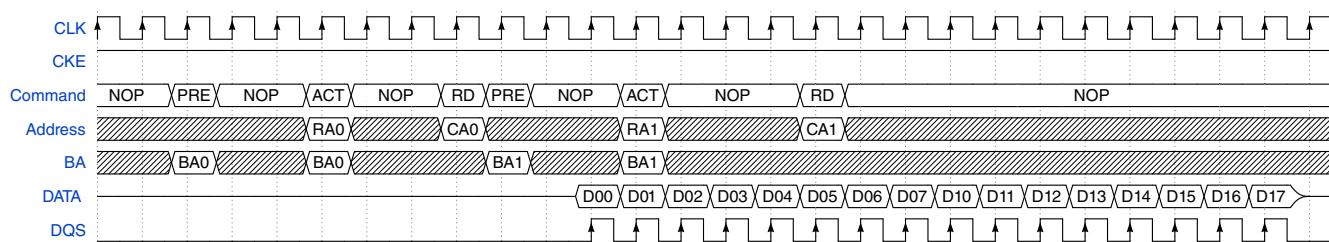

**Figure 25-13. AXI Command - SDRAM WRITE**

**NOTE**

- The SEMC opens/closes pages automatically for current AXI command.
- SDRAM device burst length is 8 in this example. The SEMC may send multiple WRITE commands if AXI burst size is larger than SDRAM burst length.

**25.3.1.4.3.3 Pipelined Access**

Figure 25-14 shows an SDRAM pipelined read access that is triggered by AXI bus read access.

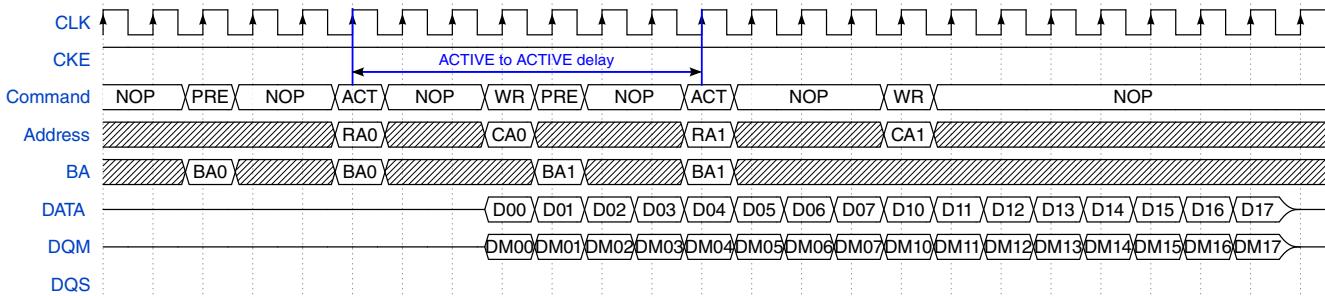

**Figure 25-14. AXI Command - Pipelined SDRAM Read**

**NOTE**

- The SEMC opens/closes pages automatically for next AXI command during SDRAM Read burst.
- Data D0x is from CA0, and data D1x is from CA1. This naming rule is also applied to the following SDRAM figures.

[Figure 25-15](#) shows the SDRAM device pipelined write access that triggered by AXI bus write access.

**Figure 25-15. AXI Command - Pipelined SDRAM Write**

**NOTE**

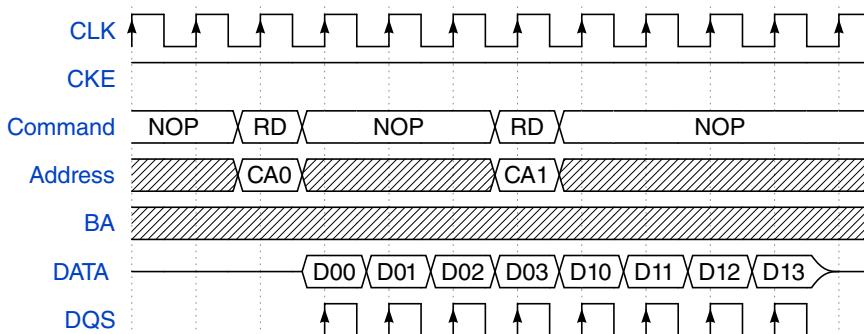

- The SEMC opens/closes pages automatically for next AXI command during SDRAM Write burst.

#### 25.3.1.4.3.4 SDRAM Back-to-Back Access

This section describes the SDRAM back-to-back access.

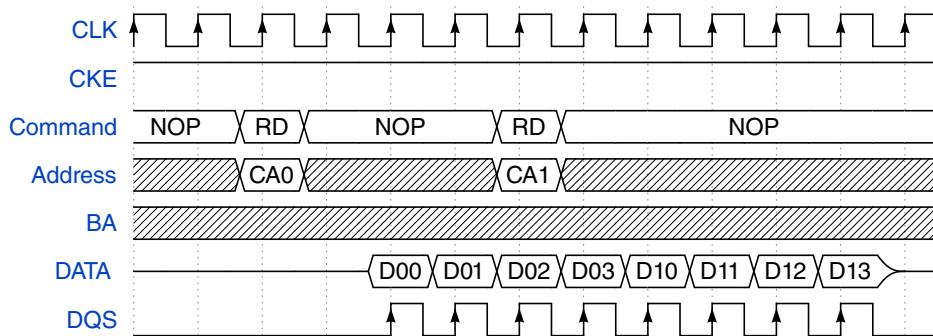

##### 25.3.1.4.3.4.1 Read-to-Read Access

[Figure 25-16](#) shows SDRAM read-to-read access timing when CL=1.

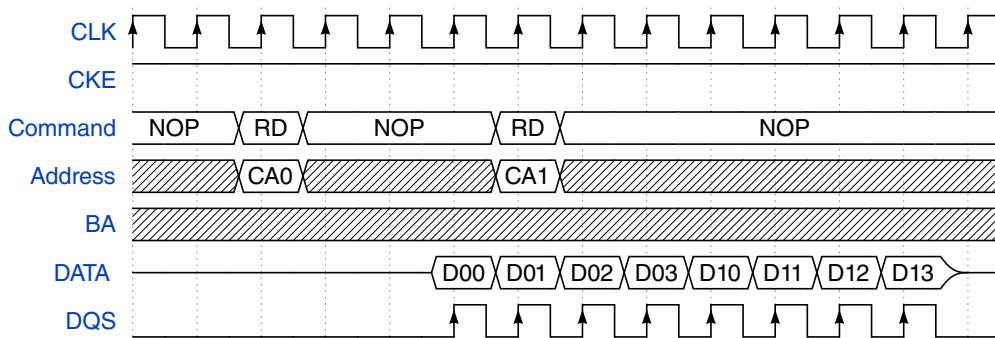

**Figure 25-16. SDRAM Read-to-Read Access (CL=1)**

Figure 25-17 shows SDRAM read-to-read access timing when CL=2.

**Figure 25-17. SDRAM Read-to-Read Access (CL=2)**

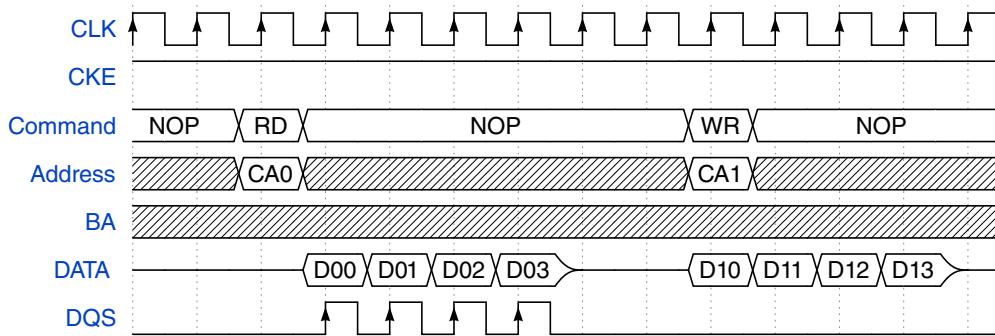

Figure 25-18 shows SDRAM read-to-read access timing when CL=3.

**Figure 25-18. SDRAM Read-to-Read Access (CL=3)**

#### 25.3.1.4.3.4.2 Read-to-Write Access

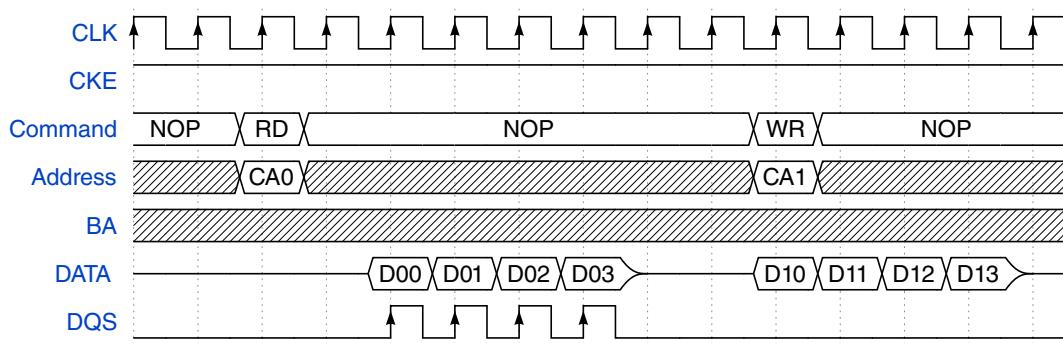

Figure 25-19 shows SDRAM read-to-write access timing when CL=1.

**Figure 25-19. SDRAM Read-to-Write Access (CL=1)**

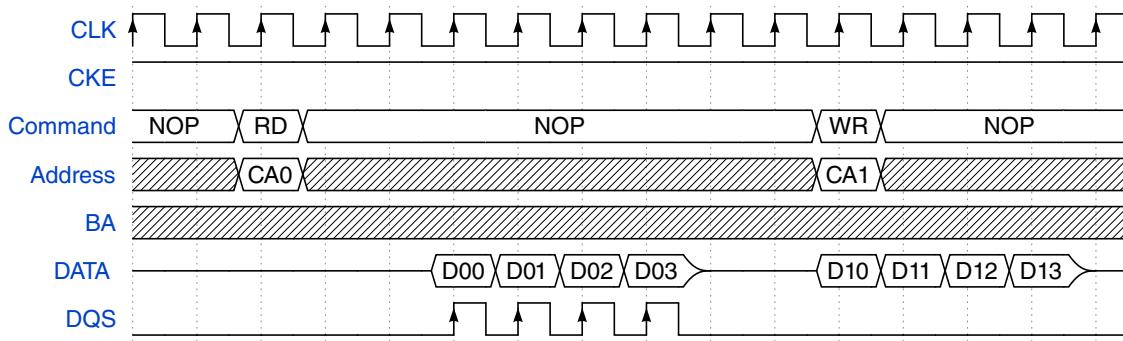

Figure 25-20 shows SDRAM read-to-write access timing when CL=2.

## Functional Description

**Figure 25-20. SDRAM Read-to-Write Access (CL=2)**

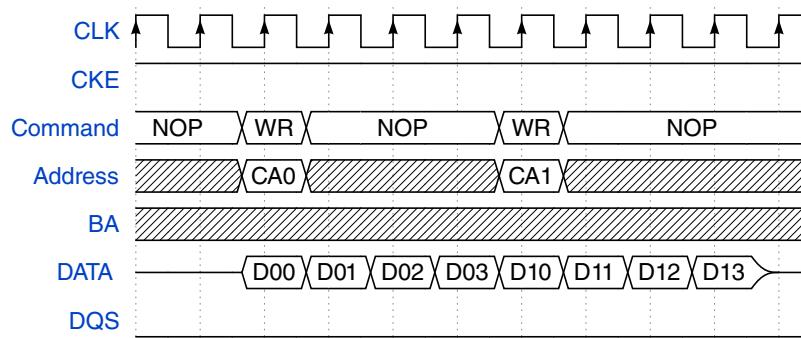

Figure 25-21 shows SDRAM read-to-write access timing when CL=3.

**Figure 25-21. SDRAM Read-to-Write Access (CL=3)**

### 25.3.1.4.3.4.3 Write-to-Write Access

Figure 25-22 shows SDRAM write-to-write access timing.

**Figure 25-22. SDRAM Write-to-Write Access**

### 25.3.1.4.3.4.4 Write-to-Read Access

Figure 25-23 shows SDRAM write-to-read access timing when CL=1.

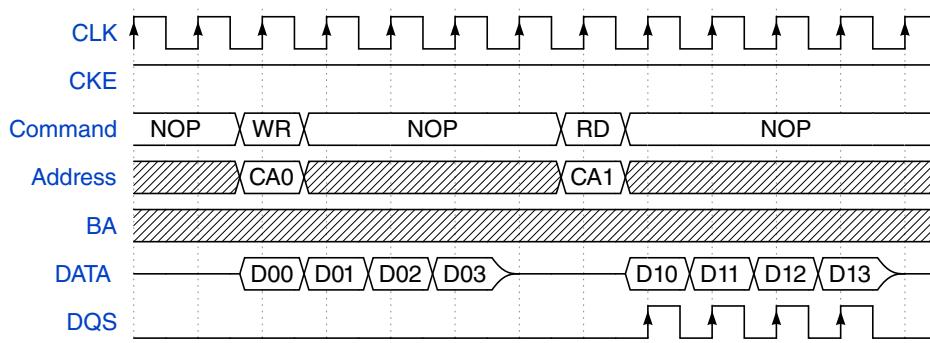

Figure 25-23. SDRAM Write-to-Read Access (CL=1)

Figure 25-24 shows SDRAM write-to-read access timing when CL=2.

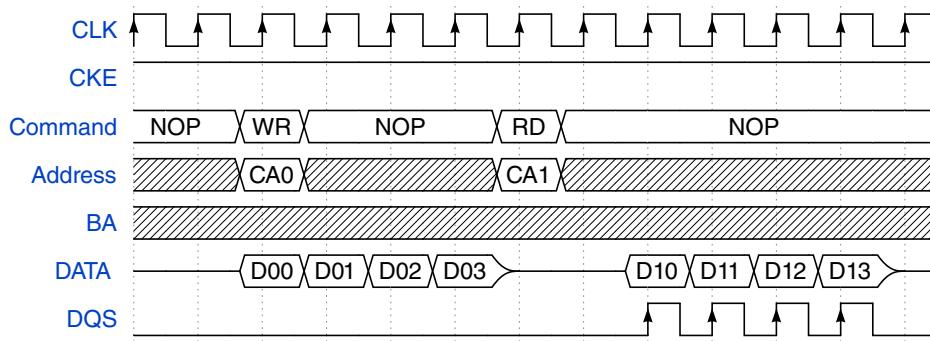

Figure 25-24. SDRAM Write-to-Read Access (CL=2)

Figure 25-25 shows SDRAM write-to-read access timing when CL=3.

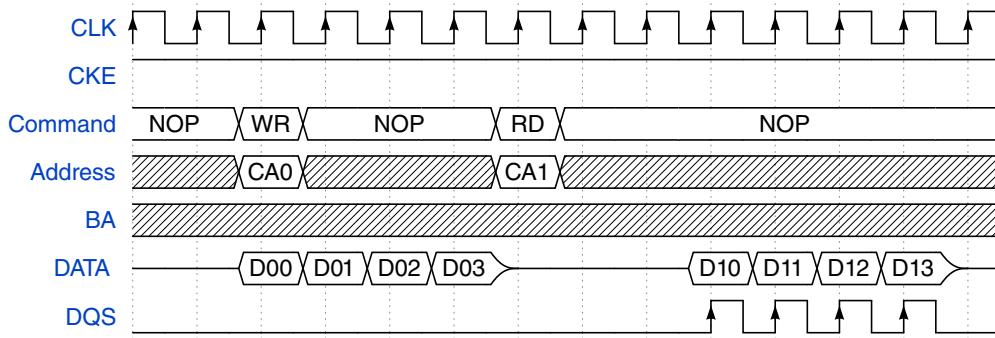

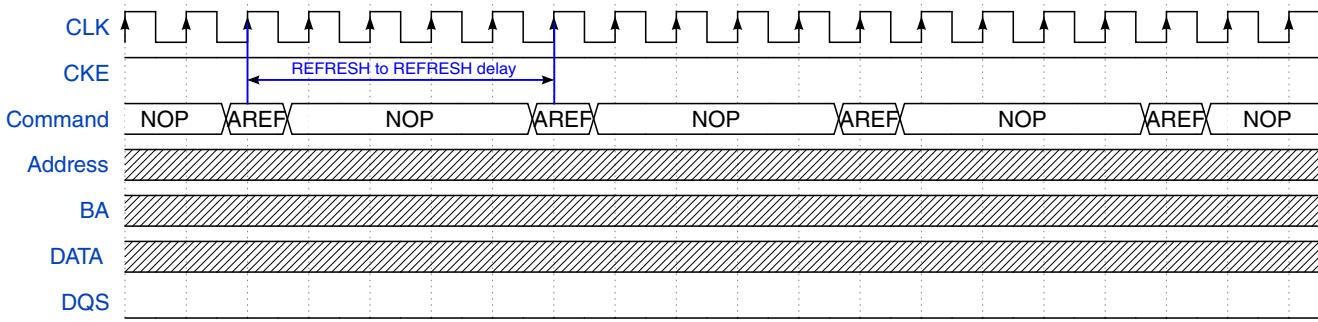

Figure 25-25. SDRAM Write-to-Read Access (CL=3)

#### 25.3.1.4.4 Refresh Command - SDRAM AUTO REFRESH

When SDRAM refresh is enabled (SDRAMCR3[REN]=1), the SEMC will send an AUTO REFRESH command to all SDRAM devices whenever the refresh timer expires. Multiple AUTO REFRESH commands can be sent if refresh burst is not set to one (SDRAMCR3[REBL]!<0>).

The refresh timer's count cycle is controlled by UT, RT and PRESCALE bits in SDRAMCR3.

Figure 25-26 shows the sequence of AUTO REFRESH Command.

**Figure 25-26. Refresh Command - SDRAM AUTO REFRESH**

#### **NOTE**

- AUTO REFRESH command is sent to all devices.
- For this example:
  - Refresh to refresh delay is 5 clock cycles (SDRAMCR2[REF2REF]=4)
  - Refresh burst length is 4 (SDRAMCR3[REBL]=3)

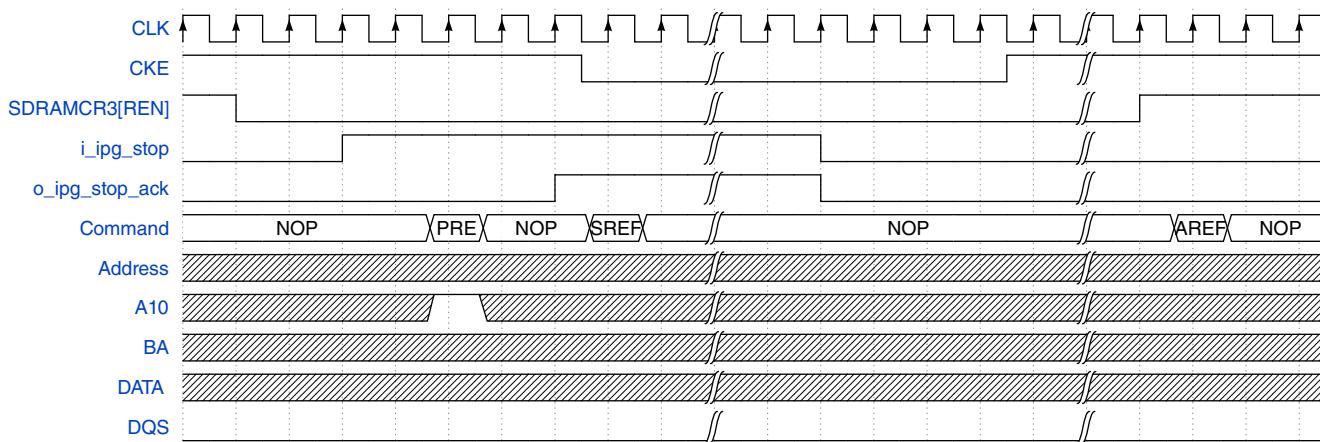

#### **25.3.1.4.5 SDRAM Low Power Feature**

This section describes the low power feature that is implemented for SDRAM.

##### **25.3.1.4.5.1 SDRAM Stop Mode**

The SEMC puts SDRAM to self refresh mode automatically when the system enters STOP mode. The SEMC brings SDRAM out of self refresh mode when the system exits STOP mode.

Figure 25-27 shows the sequence of STOP mode entering and exiting.

**Figure 25-27. SDRAM Stop Mode Enter and Exit****NOTE**

- The SEMC sends PRECHARGE ALL command to close any opened page on device before entering self refresh mode. There is no PRECHARGE ALL command if no page is opened at any device.
- SELF REFRESH command is sent to all devices.
- Disable the SEMC auto refresh bit (SDRAMCR3[REN]=0) before entering STOP mode, otherwise the SEMC may bring devices out of self refresh mode.

**25.3.1.4.5.2 SDRAM Bus Idle**

When there are no pending IP, AXI, or refresh commands, SDRAM interface will be in the idle state. When the SDRAM interface bus idle timer expires, the SEMC closes all opened pages on all SDRAM devices. Refer to SDRAMCR2[ITO] for more information.

**25.3.1.4.6 SDRAM Page Management**

This section describes the SDRAM page management.

The SEMC will save row addresses for up to 8 opened pages: 4 pages for CS0/CS2 (4 banks), 4 pages for CS1/CS3 (4 banks). Device CS0 and CS2 pages are never opened at the same time. Before the SEMC opens pages on CS2, it closes all opened pages on CS0. This is similar for CS1/CS3.

The SEMC closes all pages on all CS by issuing a PRECHARGE ALL command in following cases:

1. SELF REFRESH triggered by IP command
2. SELF REFRESH triggered by stop mode entry

3. The idle time on AXI bus and SDRAM interface is longer than SDRAM idle timeout time (SDRAMCR2[ITO]).

**NOTE**

The SEMC will not send out PRECHARGE ALL command if there are no pages opened on any bank/CS.

The SEMC will close all pages on one CS in following cases:

1. PRECHARGE ALL command triggered by IP command
2. AUTO REFRESH command triggered by IP command
3. ACTIVE/READ/WRITE command triggered by IP command and CS miss
4. WRITE/READ command triggered by current AXI command and CS miss
5. WRITE/READ command triggered by next AXI command (not accepted yet), CS miss and not same CS as current AXI command

**NOTE**

One example for CS miss: current IP command access CS2 but there is page opened on CS0 already.

The SEMC will close one page on one CS in following cases:

1. PRECHARGE command triggered by IP command and this bank is opened
2. ACTIVE/READ/WRITE command triggered by IP command, this bank is opened and page missed.
3. WRITE/READ command triggered by current AXI command, this bank is opened and page missed.
4. WRITE/READ command triggered by next AXI command (not accepted yet), this bank is opened, page missed and different bank accessed with current AXI command.

**NOTE**

One example for page miss: current bank is opened but the opened page row address is different with current SDRAM command access.

The SEMC will open one page on one CS in following cases:

1. ACTIVE/READ/WRITE command triggered by IP command, this bank is not opened.
2. WRITE/READ command triggered by current AXI command, this bank is not opened.
3. WRITE/READ command triggered by next AXI command (not accepted yet), this bank is not opened and different bank accessed with current AXI command.

**NOTE**

One example for page miss: current bank is opened but the opened page row address is different with current SDRAM command access.

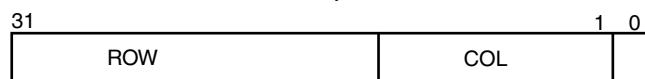

### 25.3.1.5 NAND Flash Controller Operations

This section describes the operations of NAND Flash controller.

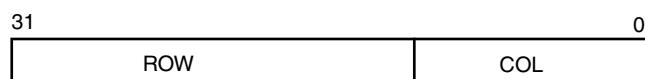

#### 25.3.1.5.1 NAND Flash Address Multiplexing

The NAND Flash controller uses a multiplexed address split into rows and columns. [Figure 25-28](#) shows how the bits of the linear address sent to the SEMC are split up into the row and column addresses sent to the NAND Flash memory device.

NAND device address map when NANDCR0.PS=0x1 (16 bit mode)

NAND device address map when NANDCR0.PS=0x0 (8 bit mode)

**Figure 25-28. NAND Flash Address Multiplexing**

**NOTE**

- NAND address bits consist of row and column address bits.
- Column address bits offset is bit 0 if NANDCR0[PS]=0, the offset is bit 1 if NANDCR0[PS]=1. Column address bit width is determined by NANDCR0[COL].
- Column bit number should cover all page size. For example, column bit number should be 14 if NAND Flash page size is 8192 + 448 (main + spare) bytes.
- Row address bits offset is determined by NANDCR0[PS] and NANDCR[COL].
- NAND device base address on SoC is configured by BR4 and BR8 registers.

#### 25.3.1.5.2 NAND Flash Access Address Type

[Table 25-3](#) lists the NAND address types that are triggered by IP commands.

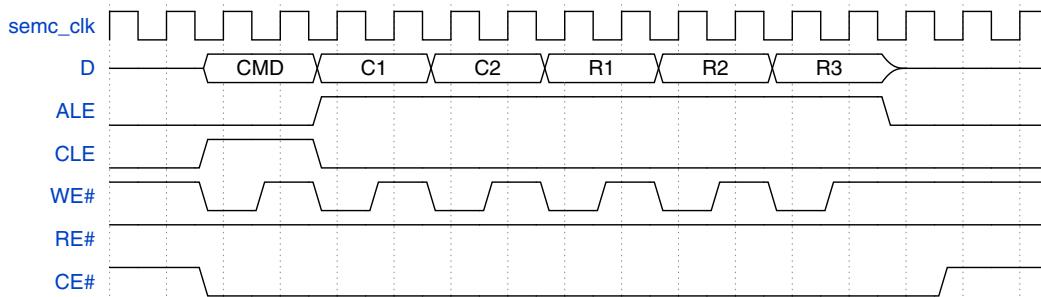

**Table 25-3. NAND Address Types**

Address Type	IPCMD[7:4]
Five Bytes Row/Column Address	0x0
One Byte Column Address	0x1
Two Bytes Column Address	0x2
One Byte Row Address	0x3
Two Bytes Row Address	0x4
Three Bytes Row Address	0x5

For IP command, address type is determined by IPCMD register. For AXI command, address type is fixed to "Two Bytes Column Address" because AXI access is limited in opened NAND page.

#### 25.3.1.5.2.1 Five Bytes Row/Column Address

[Figure 25-29](#) shows the Five Bytes Row/Column Address type access timing.

**Figure 25-29. NAND Flash Access Address Type - Five Bytes Row/Column Address**

There are some option bits to support different NAND address types in the Five Bytes Row/Column Address type. [Table 25-4](#) lists all the combinations of address types.

**Table 25-4. Address Bytes Order for five Bytes Row/Column Address Mode**

NANDCR3[NDOPT3]	NANDCR3[NDOPT2]	NANDCR3[NDOPT1]	Addres byte order
0	0	0	C1/C2/R1/R2/R3
0	0	1	C1/R1/R2/R3
0	1	0	C1/C2/R1/R2
0	1	1	C1/R1/R2
1	-	0	C1/C2/R1
1	-	1	C1/R1

### 25.3.1.5.2.2 One Byte Column Address

Figure 25-30 shows the One Byte Column Address type access timing.

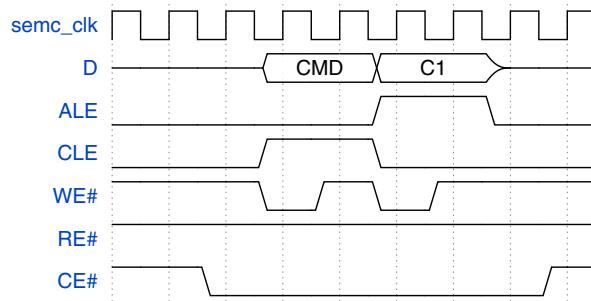

Figure 25-30. NAND Flash Access Address Type - One Byte Column Address

### 25.3.1.5.2.3 Two Bytes Column Address

Figure 25-31 shows the Two Bytes Column Address type access timing.

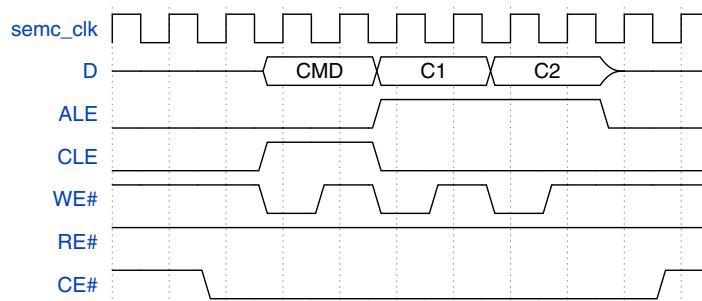

Figure 25-31. NAND Flash Access Address Type - Two Bytes Column Address

### 25.3.1.5.2.4 One Byte Row Address

Figure 25-32 shows the One Byte Row Address type access timing.

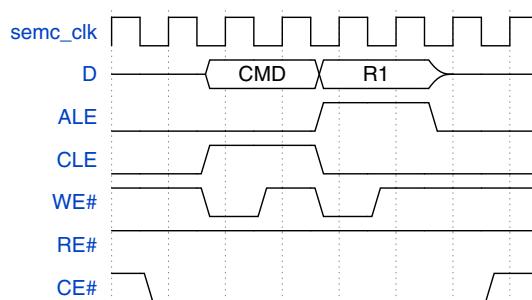

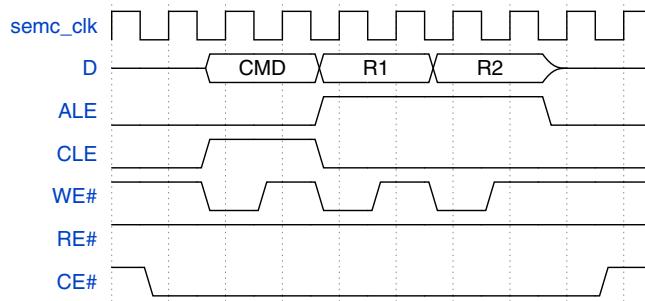

Figure 25-32. NAND Flash Access Address Type - One Byte Row Address

### 25.3.1.5.2.5 Two Bytes Row Address

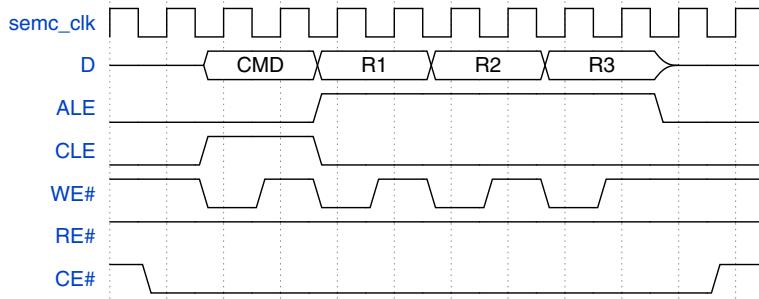

Figure 25-33 shows the Two Bytes Row Address type access timing.

**Figure 25-33. NAND Flash Access Address Type - Two Bytes Row Address**

#### 25.3.1.5.2.6 Three Bytes Row Address

Figure 25-34 shows the Three Bytes Row Address type access timing.

**Figure 25-34. NAND Flash Access Address Type - Three Bytes Row Address**

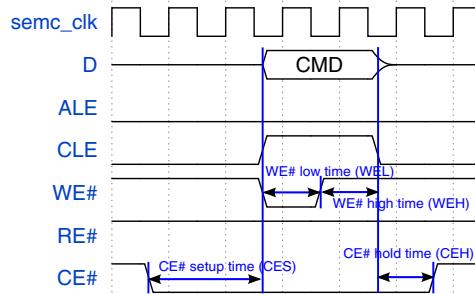

#### 25.3.1.5.3 NAND Flash Access Command Type

NAND Flash access support following command types:

1. Command Phase
2. Command + Wait Phase
3. Command + Address Phase
4. Command + Address + Wait Phase
5. Command + Address + Read Phase
6. Command + Address + Write Phase (for IP command)
7. Command + Write Phase
8. Command + Read Phase
9. Write Phase
10. Read Phase
11. Command + Address + Command + Read Phase (for AXI command - Read)
12. Command + Address + Write Phase (for AXI command - Write)

### 25.3.1.5.3.1 Command Phase

Figure 25-35 shows the NAND Flash Command Phase access timing.

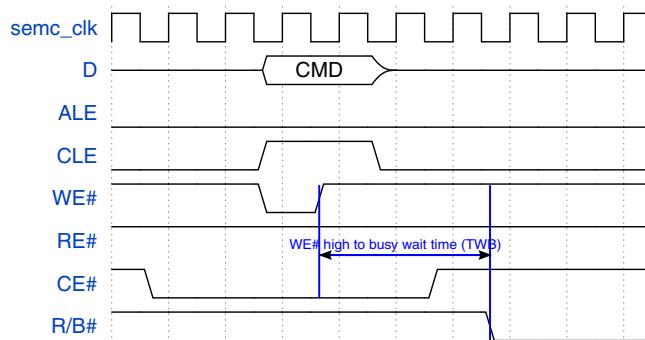

**Figure 25-35. NAND Flash Access Command Type - Command Phase**

#### NOTE

- semc\_clk is the SEMC functional clock.
- For this example:
  - CE# setup time is 2 clock cycles (NANDCR1[CES]=1)
  - WE# low time is 1 clock cycle (NANDCR1[WEL]=0)
  - WE# high time is 1 clock cycle (NANDCR1[WEH]=0)
  - CE# hold time is 1 clock cycle (NANDCR1[CEH]=0)

### 25.3.1.5.3.2 Command + Wait Phase

Figure 25-36 shows NAND Flash Command + Wait Phase access timing

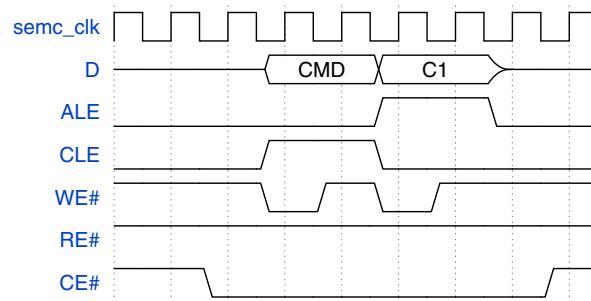

**Figure 25-36. NAND Flash Access Command Type - Command + Wait Phase**

#### NOTE

- For this example:
  - WE# high to busy time is 3 clock cycles (NANDCR1[TWB]=2)

### 25.3.1.5.3.3 Command + Address Phase

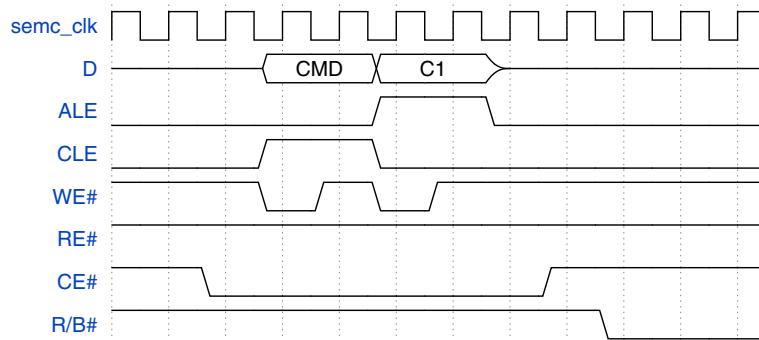

Figure 25-37 shows the NAND Flash Command + Address Phase access timing.

**Figure 25-37. NAND Flash Access Command Type - Command + Address Phase**

### 25.3.1.5.3.4 Command + Address + Wait Phase

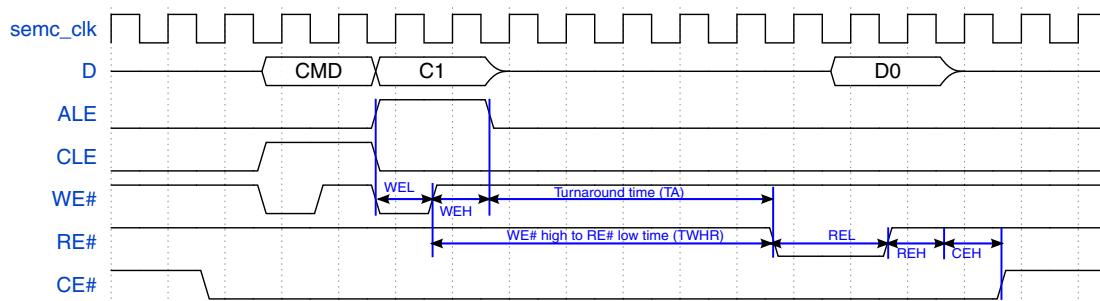

Figure 25-38 shows NAND Flash Command + Address + Wait Phase access timing.

**Figure 25-38. NAND Flash Access Command Type - Command + Address + Wait Phase**

### 25.3.1.5.3.5 Command + Address + Read Phase

Figure 25-39 shows NAND Flash Command + Address + Read Phase access timing.

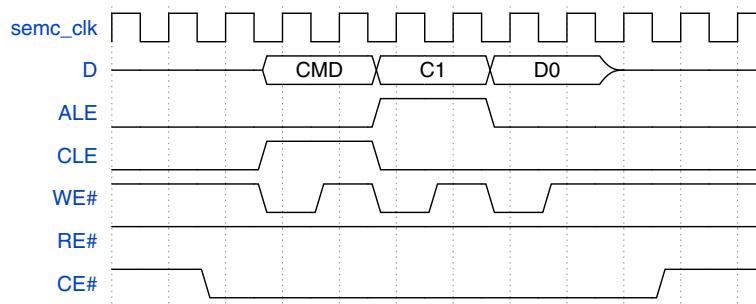

**Figure 25-39. NAND Flash Access Command Type - Command + Address + Read Phase**

**NOTE**

- For this example:
  - WE# low time is 1 clock cycle (NANDCR1[WEL]=0)
  - WE# high time is 1 clock cycle (NANDCR1[WEH]=0)
  - RE# low time is 2 clock cycles (NANDCR1[REL]=1)
  - RE# high time is 1 clock cycle (NANDCR1[REH]=0)
  - Turnaround time is 5 clock cycles (NANDCR1[TA]=4)
  - WE# high to RE# low time is 6 clock cycles (NANDCR2[TWHR]=5)
  - CE# hold time is 1 clock cycle (NANDCR1[CEH]=0)

**25.3.1.5.3.6 Command + Address + Write Phase (for IP Command)**

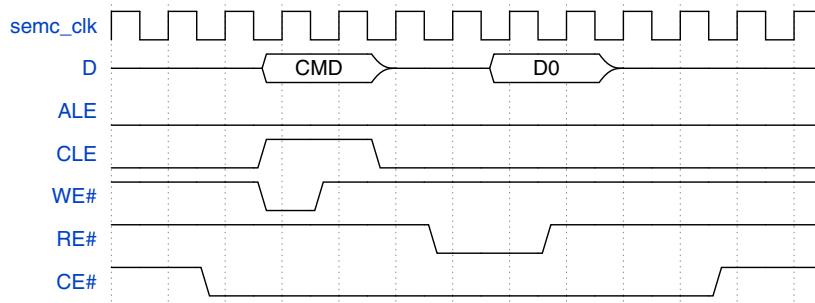

Figure 25-40 shows NAND Flash Command + Address + Write Phase access timing.

**Figure 25-40. NAND Flash Access Command Type - Command + Address + Write Phase**

**25.3.1.5.3.7 Command + Read Phase**

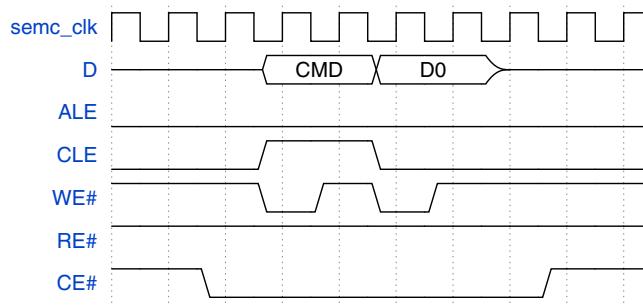

Figure 25-41 shows NAND Flash Command + Read Phase access timing.

**Figure 25-41. NAND Flash Access Command Type - Command + Read Phase**

**25.3.1.5.3.8 Command + Write Phase**

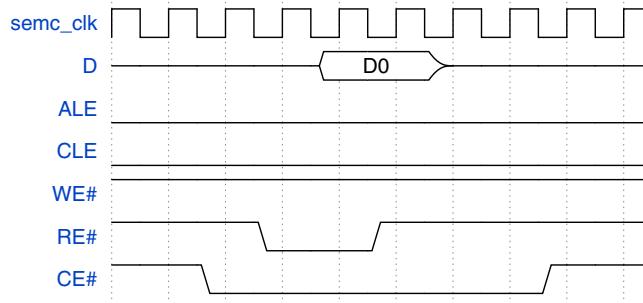

Figure 25-42 shows NAND Flash Command + Write Phase access timing.

**Figure 25-42. NAND Flash Access Command Type - Command + Write Phase**

### 25.3.1.5.3.9 Read Phase

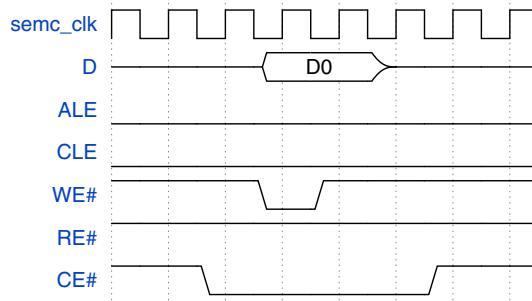

Figure 25-43 shows NAND Flash Read Phase access timing.

**Figure 25-43. NAND Flash Access Command Type - Read Phase**

### 25.3.1.5.3.10 Write Phase

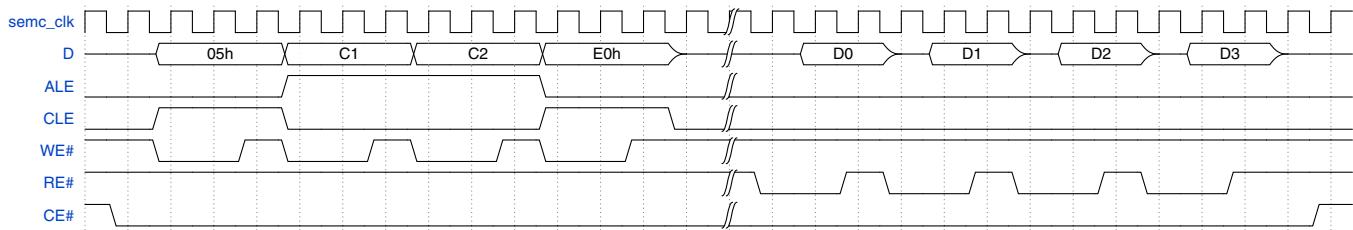

Figure 25-44 shows the timing of NAND Flash Write Phase access.

**Figure 25-44. NAND Flash Access Command type - Write Phase**

### 25.3.1.5.3.11 Command + Address + Command + Read Phase

Figure 25-45 shows the NAND Flash Command + Address + Command + Read Phase access timing.

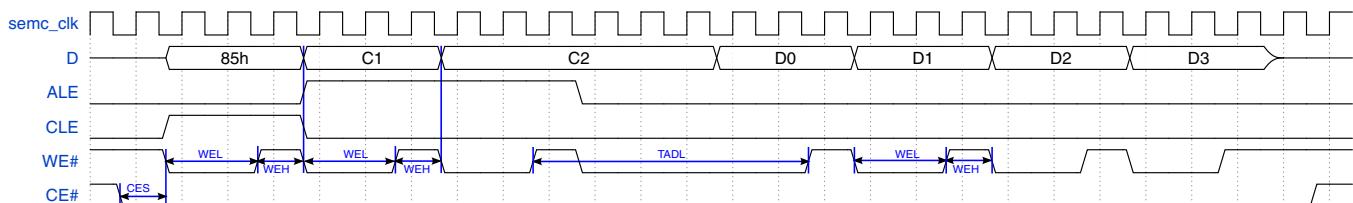

**Figure 25-45. NAND Flash Access Command Type - Command + Address + Command + Read Phase**

### NOTE

- This command type is for AXI command only
- The command code in this command type is fixed value (Change Column Address) to support ONFI NAND device. The first byte command code is 05h, and second byte command code is E0h.
- The address type in this command type is fixed to two byte column address.

#### 25.3.1.5.3.12 Command + Address + Write Phase (for AXI command)

Figure 25-46 shows the NAND Flash Command + Address + Write Phase access timing.

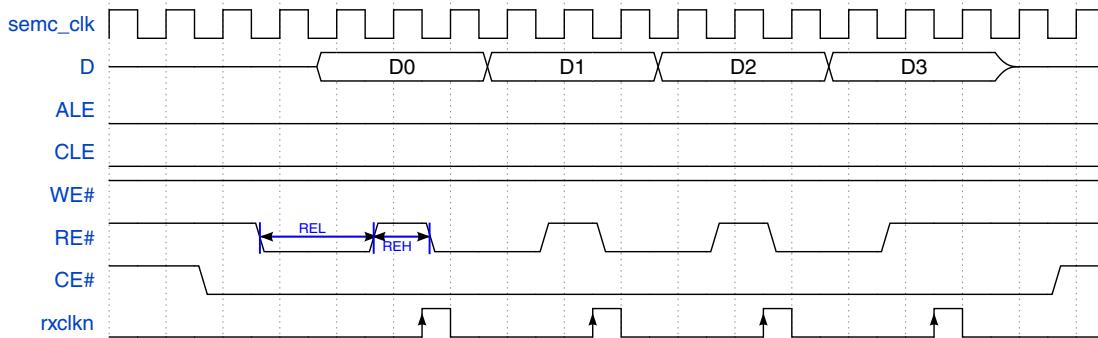

**Figure 25-46. NAND Flash Access Command Type - Command + Address + Write Phase**

### NOTE

- This command type is for AXI command only
- The command code in this command type is fixed value (85h - Change Write Column Address) to support ONFI NAND device.
- The address type in this command type is fixed to two byte column address.
- For this example:
  - WE# low time is 2 clock cycles (NANDCR1[WEL]=1)
  - WE# high time is 1 clock cycle (NANDCR1[WEH]=0)
  - Address cycle to data loading time is 6 clock cycles (NANDCR2[TADL]=5)

### 25.3.1.5.4 NAND Flash Read Access in EDO and non-EDO Mode

NAND Flash support both EDO and non-EDO modes. [Figure 25-47](#) shows the access timing of EDO mode.

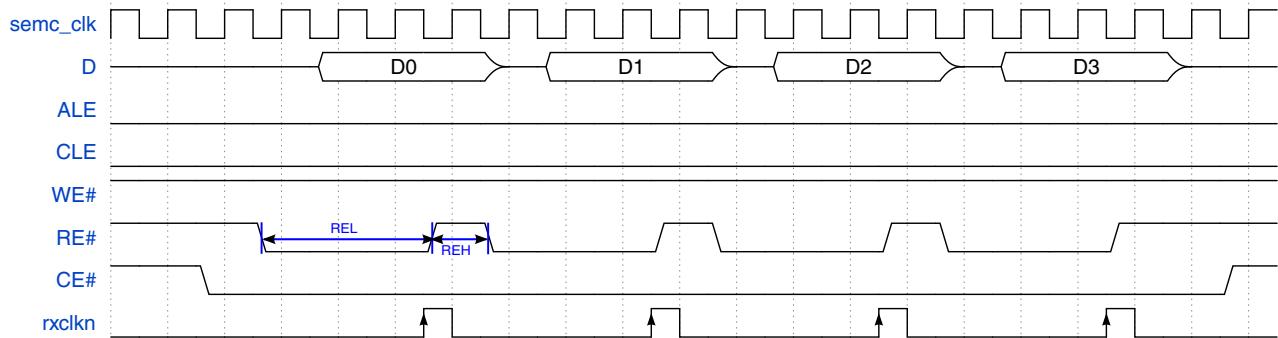

**Figure 25-47. NAND Flash Read Acess in EDO mode**

#### NOTE

- rxclkn is the SEMC internal clock to sample read data. It is close to falling edge of RE#.
- For this example:
  - RE# low time is 2 clock cycles (NANDCR1[REL]=1)
  - RE# high time is 1 clock cycle (NANDCR1[REH]=0)

[Figure 25-48](#) shows the access timing of non-EDO mode.

**Figure 25-48. NAND Flash Read Acess in non-EDO mode**

#### NOTE

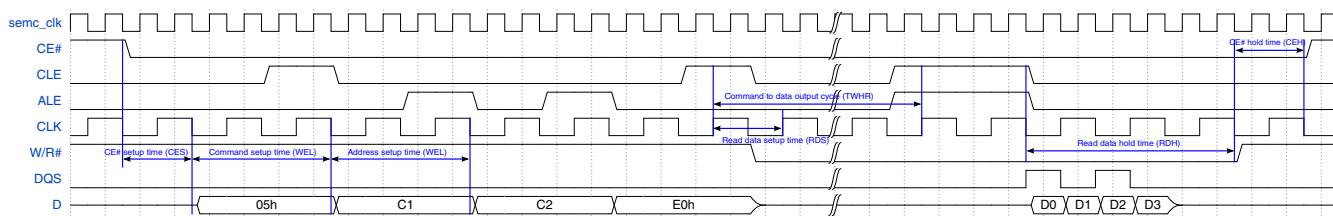

- rxclkn is the SEMC internal clock to sample read data. It is close to rising edge of RE#.
- For this example:
  - RE# low time is 3 clock cycles (NANDCR1[REL]=2)
  - RE# high time is 1 clock cycle (NANDCR1[REH]=0)

### 25.3.1.5.5 NAND Flash Access in SYNC Mode

NAND Flash supports SYNC mode, the following chapters describes the access timings.

#### 25.3.1.5.5.1 NAND Command + Address + Command + Read Operation in SYNC Mode

Figure 25-49 shows NAND Command + Address + Command + Read operation in SYNC mode.

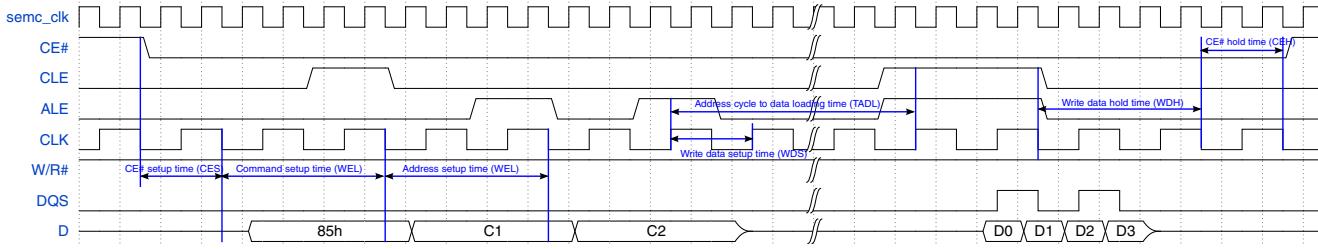

**Figure 25-49. NAND Command + Address + Command + Read in SYNC Mode**

#### NOTE

- semc\_clk is the SEMC internal functional clock. CLK is the synchronous clock to latch command and address cycles. The frequency of CLK is half of semc\_clk. For example, if semc\_clk frequency is 200 MHz, the CLK frequency is 100 MHz.
- For this example:
  - CE# setup time is 2 clock cycles (NANDCR1[CES]=1)
  - Command/Address setup time is 4 clock cycles (NANDCR1[WEL]=2)
  - NANDCR3[RDS] and NANDCR2[TWHR] control the timing from command to data read phase. In general, NANDCR3[RDS] controls the minimum delay before data read phase. In this figure, NANDCR3[RDS]=0.
  - Read data hold time is 6 clock cycles (NANDCR3[RDH]=4)
  - CE# hold time is 2 clock cycles (NANDCR1[CEH]=1)

#### 25.3.1.5.5.2 NAND Command + Address + Write Operation in SYNC Mode

Figure 25-50 shows NAND Command + Address + Write operation in SYNC mode.

**Figure 25-50. NAND Command + Address + Write in SYNC Mode****NOTE**

- For this example:
  - CE# setup time is 2 clock cycles (NANDCR1[CES]=1)
  - Command/Address setup time is 4 clock cycles (NANDCR1[WEL]=2)
  - NANDCR3[WDS] and NANDCR2[TADL] control the timing from command to data write phase. In general, NANDCR3[WDS] controls the minimum delay before data write phase. In this figure, NANDCR3[WDS]=0.
  - Write data hold time is 4 clock cycles (NANDCR3[WDH]=2)
  - CE# hold time is 2 clock cycles (NANDCR1[CEH]=1)

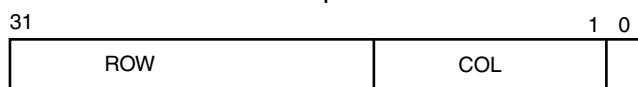

### 25.3.1.6 NOR Flash Controller Operations

This section describes the operations of NOR Flash controller.

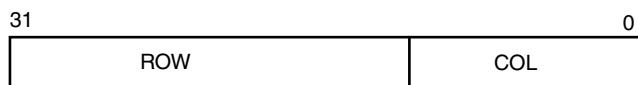

#### 25.3.1.6.1 NOR Flash Address Multiplexing

NOR Flash use a multiplexed address split into rows and columns. [Figure 25-51](#) shows how the bits of the linear address sent to the SEMC are split up into the row and column addresses sent to the NOR Flash memory device.

NOR device address map when NORCR0.PS=0x1 (16 bit mode)

NOR device address map when NORCR0.PS=0x0 (8 bit mode)

**Figure 25-51. NOR Flash Address Multiplexing**

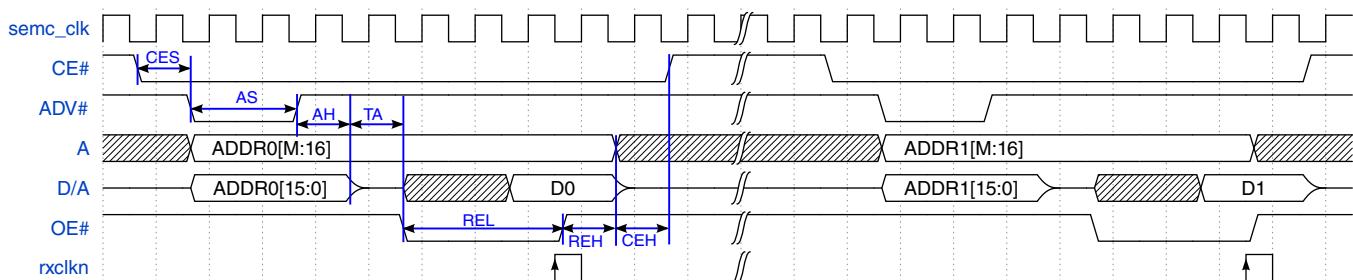

**NOTE**

- NOR address bits consist of row and column address bits.
- Column address bits offset is bit 0 if NORCR0[PS]=0 and bit 1 if NORCR0[PS]=1. Column address bit width is determined by NORCR0[COL].
- Row address bits offset is determined by NORCR0[PS] and NORCR0[COL].
- NOR device base address on SoC is configured by BR5 register.

**25.3.1.6.2 NOR Flash Read Operation in ASYNC Mode**

NOR Flash controller supports following address modes, which setting by NORCR0[AM].

Figure 25-52 shows the ASYNC NOR Flash read in ADMUX address mode.

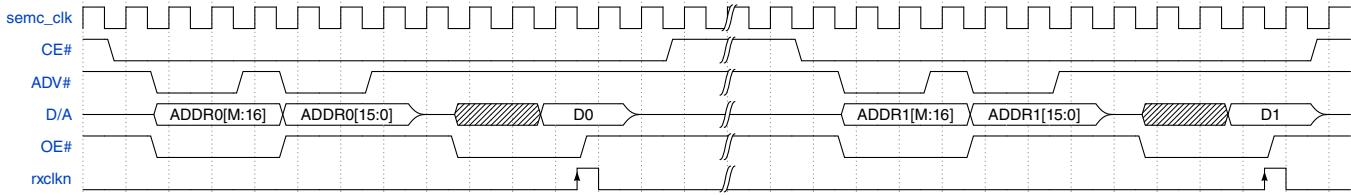

**Figure 25-52. ASYNC NOR Flash Read in ADMUX Address Mode**

**NOTE**

- semc\_clk and rxclkn are the internal signals. semc\_clk is the SEMC functional clock. rxclkn is the clock to sample data from NOR Flash.
- For this example:
  - CE# setup time is 1 clock cycle (NORCR1[CES]=0)
  - Address setup time is 2 clock cycles (NORCR1[AS]=1)
  - Address hold time is 1 clock cycle (NORCR1[AH]=0)
  - Turnaround time is 1 clock cycle (NORCR2[TA]=0)
  - OE# low time is 3 clock cycles (NORCR1[REL]=2)
  - OE# high time is 1 clock cycle (NORCR1[REH]=0)
  - CE# hold time is 1 clock cycle (NORCR1[CEH]=0)

Figure 25-53 shows the ASYNC NOR Flash read in AADM address mode.

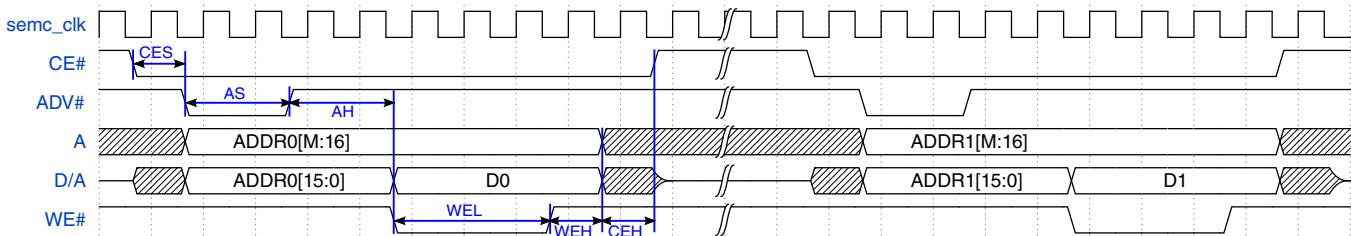

## Functional Description

**Figure 25-53. ASYNC NOR Flash Read in AADM Address Mode**

### 25.3.1.6.3 NOR Flash Write Operation in ASYNC Mode

Figure 25-54 shows the ASYNC NOR Flash write in ADMUX address mode.

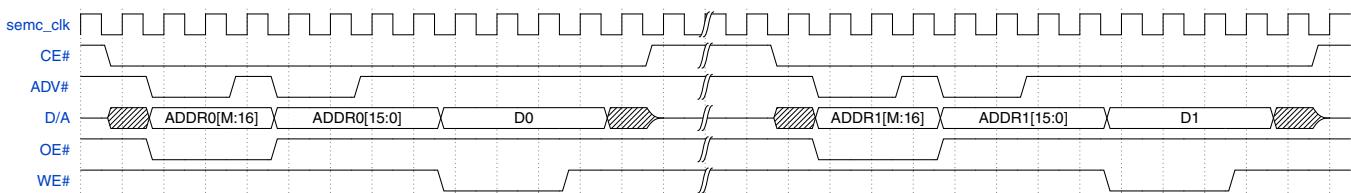

**Figure 25-54. ASYNC NOR Flash Write in ADMUX Address Mode**

#### NOTE

- semc\_clk is the SEMC functional clock.
- For this example:
  - CE# setup time is 1 clock cycle (NORCR1[CES]=0)
  - Address setup time is 2 clock cycles (NORCR1[AS]=1)
  - Address hold time is 2 clock cycles (NORCR1[AH]=1)
  - WE# low time is 3 clock cycles (NORCR1[WEL]=2)
  - WE# high time is 1 clock cycle (NORCR1[WEH]=0)
  - CE# hold time is 1 clock cycle (NORCR1[CEH]=0)

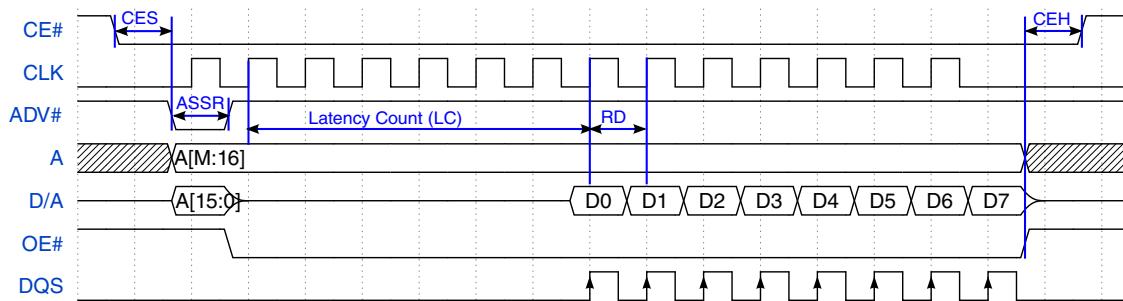

Figure 25-55 shows the ASYNC NOR Flash write in AADM address mode.

**Figure 25-55. ASYNC NOR Flash Write in AADM Address Mode**

### 25.3.1.6.4 NOR Flash Read Operation in SYNC Mode

Figure 25-56 shows the SYNC NOR Flash read in ADMUX address mode.

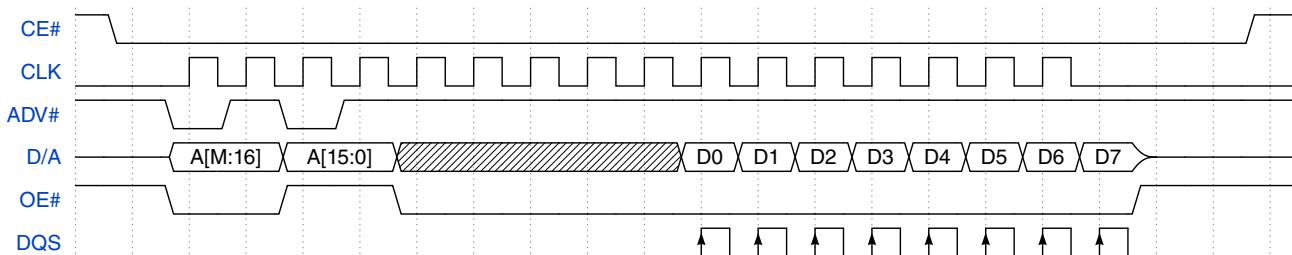

**Figure 25-56. SYNC Flash Read in ADMUX Address Mode**

#### NOTE

- DQS is the clock to sample data from NOR Flash. It generally loops back from DQS pad.
- For this example:
  - CE# setup time is 1 clock cycle (NORCR1[CES]=0)
  - Address setup time is 1 clock cycle (NORCR3[ASSR]=0)
  - Latency count is 6 clock cycles (NORCR2[LC]=6)
  - Read time is 1 clock cycle (NORCR2[RD]=0)
  - CE# hold time is 1 clock cycle (NORCR1[CEH]=0)

Figure 25-57 shows the SYNC NOR Flash read in AADM address mode.

**Figure 25-57. SYNC Flash Read in AADM Address Mode**

#### 25.3.1.6.5 NOR Flash Write Operation in SYNC Mode

Flash write operation in SYNC mode is same as asynchronous.

#### 25.3.1.7 SRAM Controller Operations

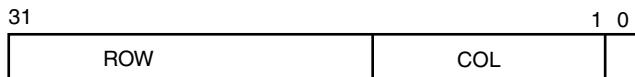

This section describes the operations of SRAM controller.

##### 25.3.1.7.1 SRAM Address Multiplexing

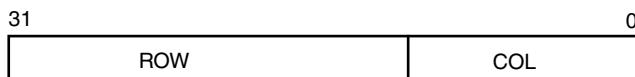

## Functional Description

SRAM use a multiplexed address split into rows and columns. Figure 25-58 shows how the bits of the linear address sent to the SEMC are split up into the row and column addresses sent to the SRAM memory device.

SRAM device address map when SRAMCR0.PS=0x1 (16 bit mode)

SRAM device address map when SRAMCR0.PS=0x0 (8 bit mode)

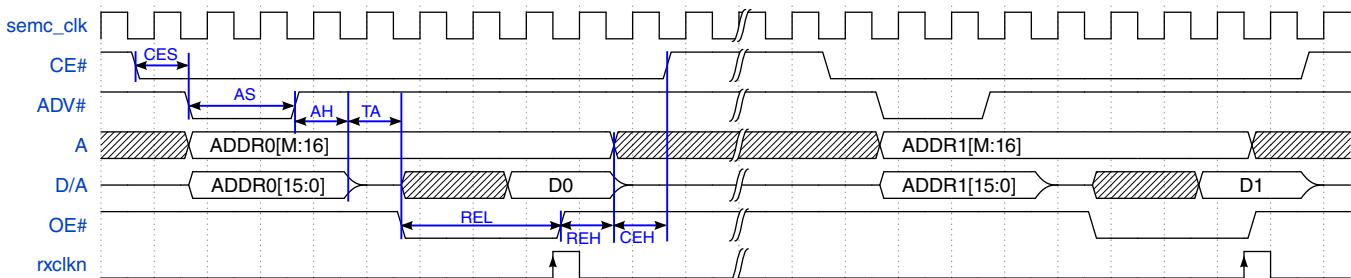

**Figure 25-58. SRAM Address Multiplexing**

### NOTE

- SRAM address bits consist of row and column address bits.
- Column address bits offset is bit 0 if SRAMCR0[PS]=0, offset is bit 1 if SRAMCR0[PS]=1. Column address bit width is determined by SRAMCR0[COL].
- Row address bits offset is determined by SRAMCR0[PS] and SRAMCR0[COL].
- SRAM device base address on SoC is configured by BR6 register.

### 25.3.1.7.2 SRAM Read Operation in ASYNC Mode

Figure 25-59 shows the ASYNC SRAM read in ADMUX address mode.

**Figure 25-59. ASYNC SRAM Read in ADMUX Address Mode**

### NOTE

- semc\_clk and rxclkn are the internal signals. semc\_clk is the SEMC functional clock. rxclkn is the clock to sample data from SRAM.
- For this example:

- CE# setup time is 1 clock cycle (SRAMCR1[CES]=0)
- Address setup time is 2 clock cycles (SRAMCR1[AS]=1)
- Address hold time is 1 clock cycle (SRAMCR1[AH]=0)
- Turnaround time is 1 clock cycle (SRAMCR2[TA]=0)
- OE# low time is 3 clock cycles (SRAMCR1[REL]=2)
- OE# high time is 1 clock cycle (SRAMCR1[REH]=0)
- CE# hold time is 1 clock cycle (SRAMCR1[CEH]=0)

Figure 25-60 shows the ASYNC SRAM read in AADM address mode.

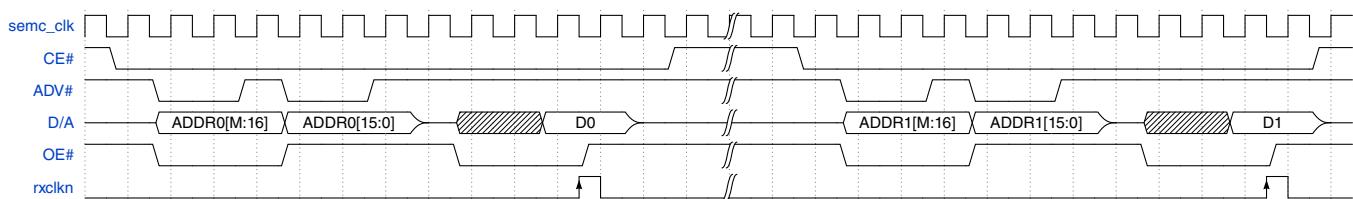

Figure 25-60. ASYNC SRAM Read in AADM Address Mode

### 25.3.1.7.3 SRAM Write Operation in ASYNC Mode

Figure 25-61 shows the ASYNC SRAM write in ADMUX address mode.

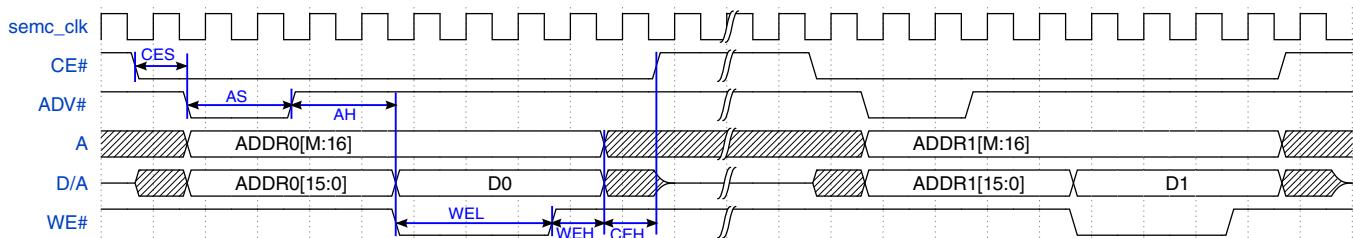

Figure 25-61. ASYNC SRAM Write in ADMUX Address Mode

#### NOTE

- For this example:
  - CE# setup time is 1 clock cycle (SRAMCR1[CES]=0)
  - Address setup time is 2 clock cycles (SRAMCR1[AS]=1)
  - Address hold time is 2 clock cycles (SRAMCR1[AH]=1)
  - WE# low time is 3 clock cycles (SRAMCR1[WEL]=2)
  - WE# high time is 1 clock cycle (SRAMCR1[WEH]=0)
  - CE# hold time is 1 clock cycle (SRAMCR1[CEH]=0)

Figure 25-62 shows the ASYNC SRAM write in AADM address mode.

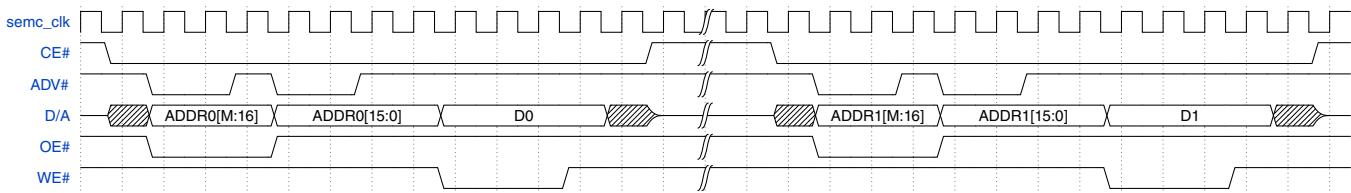

Figure 25-62. ASYNC SRAM Write in AADM Address Mode

#### 25.3.1.7.4 SRAM Register Operation in ASYNC Mode

Figure 25-63 shows the ASYNC SRAM register access in ADMUX address mode.

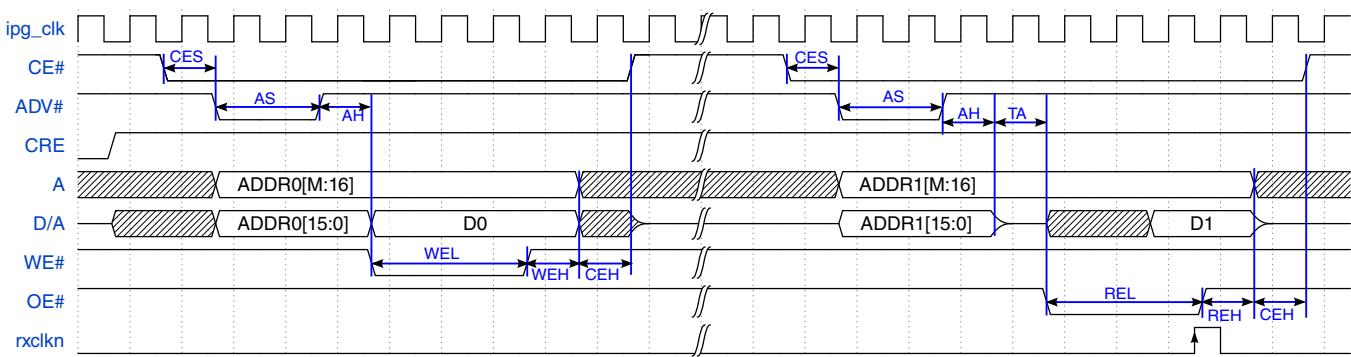

Figure 25-63. ASYNC SRAM Register Access in ADMUX Address Mode

#### NOTE

- For this example:
  - First operation is SRAM register write access. ADDR0[M:0] contains the value for writing to SRAM register. The value of D0 can be ignored.
  - Second operation is SRAM register read access. ADDR1[M:0] contains the value for choosing of SRAM register. D1 is the value that read from SRAM register.
  - The value of ADDR0/1 comes from IPCR0 register.
    - If BR6[BA]=0x98000 and IPCR0=0x9810883E, ADDR0/1 is 0x8441F when port size is 16bit mode. The address is divided by 2 in 16bit mode.
    - If BR6[BA]=0x98000 and IPCR0=0x9810883E, ADDR0/1 is 0x10883E when port size is 8bit mode.
  - CE# setup time is 1 clock cycle (SRAMCR1[CES]=0)

- Address setup time is 2 clock cycles (SRAMCR1[AS]=1)
- Address hold time is 1 clock cycle (SRAMCR1[AH]=0)
- WE# low time is 3 clock cycles (SRAMCR1[WEL]=2)
- WE# high time is 1 clock cycle (SRAMCR1[WEH]=0)
- CE# hold time is 1 clock cycle (SRAMCR1[CEH]=0)
- Turnaround time is 1 clock cycle (SRAMCR2[TA]=0)
- OE# low time is 3 clock cycles (SRAMCR1[REL]=2)
- OE# high time is 1 clock cycle (SRAMCR1[REH]=0)

### 25.3.1.7.5 SRAM Read Operation in SYNC Mode

Figure 25-64 shows the SYNC SRAM read in ADMUX address mode.

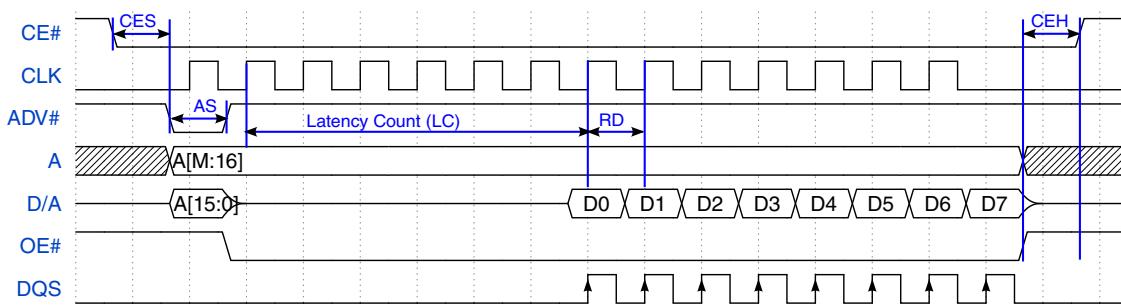

Figure 25-64. SYNC SRAM Read in ADMUX Address Mode

#### NOTE

- DQS is the clock to sample data from SRAM. It generally loops back from DQS pad.
- For this example:
  - CE# setup time is 1 clock cycle (SRAMCR1[CES]=0)
  - Address setup time is 1 clock cycle (SRAMCR1[AS]=0)
  - Latency count is 6 clock cycles (SRAMCR2[LC]=6)
  - Read time is 1 clock cycle (SRAMCR2[RD]=0)
  - CE# hold time is 1 clock cycle (SRAMCR1[CEH]=0)

### 25.3.1.7.6 SRAM Write Operation in SYNC Mode

Figure 25-65 shows the SYNC SRAM write in ADMUX address mode.

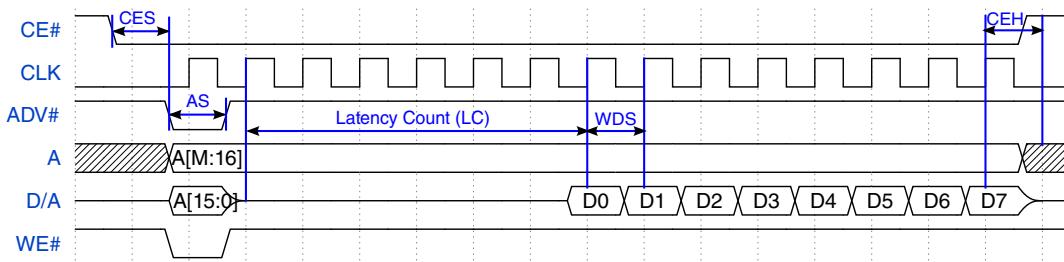

Figure 25-65. SRAM Write in SYNC Mode (ADMUX)

**NOTE**

- For this example:
  - CE# setup time is 1 clock cycle (SRAMCR1[CES]=0)
  - Address setup time is 1 clock cycle (SRAMCR1[AS]=0)
  - Latency count is 6 clock cycles (SRAMCR2[LC]=6)
  - Write data setup time is 1 clock cycle (SRAMCR2[WDS]=0)
  - CE# hold time is 1 clock cycle (SRAMCR1[CEH]=0)

### 25.3.1.8 Display Bus Interface Controller Operations

This section describes the operations of DBI controller.

DCX signal is controlled by write address. Write access to DBI is handled as DBI COMMAND WRITE transaction if address is higher than 0x10000 (DCX low). Otherwise, it is handled as DBI DATA WRITE transaction (DCX high).

For example, if BR7[BA]=0x9C000:

- An AXI write to address 0x9C010000 is treated as DBI COMMAND WRITE transaction.
- An AXI write to address 0x9C000000 is treated as DBI DATA WRITE transaction.

Figure 25-66 shows DBI write operation.

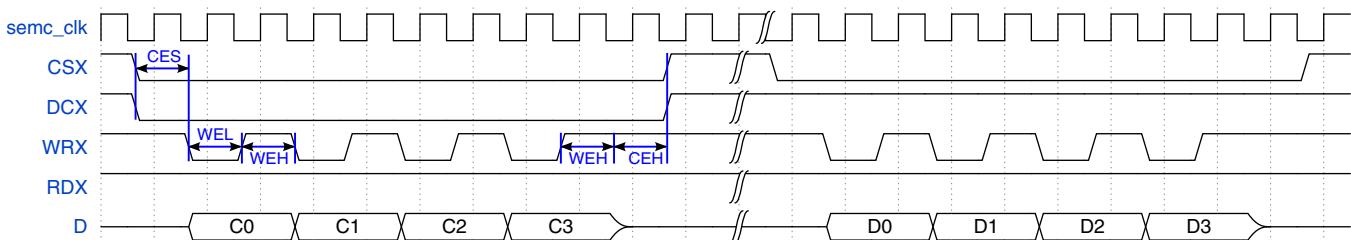

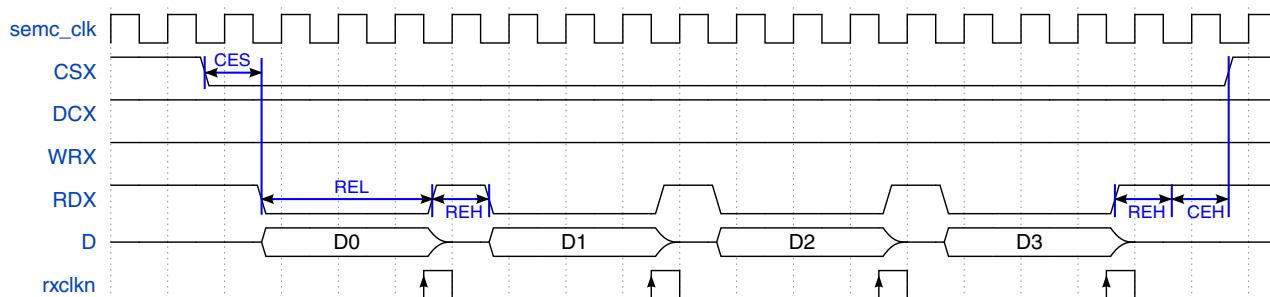

Figure 25-66. DBI Write Operation

## NOTE

- DBI address is used to determine DBI COMMAND or DATA WRITE.
- DBI bus never send out address information for COMMAND and DATA WRITE.
- AXI WRAP write access to DBI is supported.
- DBI bus interface does not support WRITE mask feature.
- All write strobe in AXI write access to DBI must be valid. If AXI write strobe is invalid, the SEMC sends write data 0x00 instead of original write data.
- When DBI bus is 16 bit (DBICR0[PS]=1), AXI or IP command access start address to DBI bus must be 16 bit aligned. Otherwise the write data to DBI may be wrong. There is no bus error response or internal error status generated for this case.
- For this example:
  - CSX setup time is 1 clock cycle (DBICR1[CES]=0)
  - WRX low time is 1 clock cycle (DBICR1[WEL]=0)
  - WRX high time is 1 clock cycle (DBICR1[WEH]=0)
  - CSX hold time is 1 clock cycle (DBICR1[CEH]=0)

[Figure 25-67](#) shows DBI read operation.

**Figure 25-67. DBI Read Operation**

## NOTE

- Read access to DBI is always handled as DBI DATA READ transaction.
- DBI bus never sent out address information for DATA READ command.
- AXI WRAP read access to DBI is not supported except when the first beat address offset is zero in the burst.
- When DBI bus is 16 bit (DBICR0[PS]=1), AXI command or IP command access start address to DBI bus must be 16 bit aligned. Otherwise the read data is unknown. There is

no bus error response or internal error status generated for this case.

- For this example:
  - CSX setup time is 1 clock cycle (DBICR1[CES]=0)
  - RDX low time is 3 clock cycles (DBICR1[REL]=2)
  - RDX high time is 1 clock cycle (DBICR1[REH]=0)
  - CSX hold time is 1 clock cycle (DBICR1[CEH]=0)

## 25.3.2 Clocks

There is one clock used for the SEMC AXI bus, IP bus, internal logic and external interface. It is shown as semc\_clk in SEMC timing figures.

## 25.3.3 Reset

There is a hardware reset for the SEMC, which reset all the logic inside it. When set MCR[SWRST], there will be a software reset to reset all logic in the SEMC except configuration registers.

## 25.3.4 Interrupts

There is an interrupt output from the SEMC. It indicates the interrupt source that defined in INTR register. The interrupt source is enabled by INTEN register.

## 25.4 External Signals

[Table 25-5](#) lists the SEMC module signals.

**Table 25-5. SEMC Signals**

Signal	Direction	Description
SEMC_DATA[15-00]	I/O	Data/Address Bits The SEMC have several controllers, and they share pins. SEMC_DATA works as data signal in SDRAM/NAND/8080 applications and works as data or address signal in NOR/SRAM applications. For detail pin mux information, refer to <a href="#">Pin Mux</a> .
SEMC_DM[1-0]	O	Write Data Mask Bits

*Table continues on the next page...*

**Table 25-5. SEMC Signals  
(continued)**

Signal	Direction	Description
SEMC_ADDR[12-00]	O	Address Bits SEMC_ADDR08 can work as chip select pin in NAND/NOR/SRAM/8080 applications.
SEMC_BA[1-0]	O	Bank Address Bits SEMC_BA0 can work as WAIT in SRAM application. SEMC_BA1 can work as ALE/ADV#/DCX in NAND/NOR/SRAM/8080 applications.
SEMC_CAS	O	SDRAM Column Address Strobe
SEMC_RAS	O	SDRAM Row Address Strobe
SEMC_WE	O	SDRAM Write Enable
SEMC_CKE	O	SDRAM Clock enable
SEMC_CLK	O	SDRAM Clock
SEMC_CS0	O	SDRAM Chip Select 0
SEMC_CSX[3-0]	O	Configurable Chip Select bits
SEMC_RDY	I/O	Ready input pin for NAND It can also work as chip select pin in SDRAM/NOR/SRAM/8080 applications.
SEMC_DQS	I/O	DQS SEMC controller provides internal dummy read strobe for read data from SDRAM/NOR/SRAM. Higher read frequency can be achieved by looping back this dummy read strobe from pad. This pin can be floated or put some cap loads on board level to compensate DATA/CLK pins load.
SEMC_DQS4	I/O	DQS Data read strobe for NAND Flash.
SEMC_CLKX0	O	Configurable clock 0 for NOR/SRAM
SEMC_CLKX1	O	Configurable clock 1 for NOR/SRAM

## 25.4.1 Pin Mux

Table 25-6 lists the pin mux of the SEMC module.

**Table 25-6. SEMC Pin Mux Overview**

Signal	SDRAM	NAND	NOR (ADMUX 16bit)	SRAM (ADMUX 16bit)	DBI	Comment
SEMC_DATA00	D0	D0	D0/A0	D0/A0	D0	Hardware MUX
SEMC_DATA01	D1	D1	D1/A1	D1/A1	D1	The SEMC determines the pin function according to its internal state
SEMC_DATA02	D2	D2	D2/A2	D2/A2	D2	
SEMC_DATA03	D3	D3	D3/A3	D3/A3	D3	

Table continues on the next page...

**Table 25-6. SEMC Pin Mux Overview (continued)**

Signal	SDRAM	NAND	NOR (ADMUX 16bit)	SRAM (ADMUX 16bit)	DBI	Comment
SEMC_DATA04	D4	D4	D4/A4	D4/A4	D4

SEMC_CLKX0	-	-	CLK	CLK	-	Configured by IOCR[MUX_CLKX0]
SEMC_CLKX1	-	-	CLK	CLK	-	Configured by IOCR[MUX_CLKX1]

**NOTE**

- IOCR configuration should be static. Dynamic remapping of pin muxing controlled by IOCR is not supported.
- NOR and SRAM pins are configured as 16 bit ADMUX mode in above table. It is the recommended configuration.

## 25.5 Initialization

To initialize the block:

- Ensure the clock for the SEMC is enabled.
- Configure corresponding pin MUX for the SEMC external signals.
- Configure registers of the SEMC properly, according to the applications.
- Configure the Module Control Register and clear MCR[MDIS] bit to enable the SEMC module.
- Reset SEMC optionally by setting the MCR[SWRST] bit.

## 25.6 Application Information

This section describes applications supported by the SEMC module.

### 25.6.1 SDRAM Application

This section provides the example sequences for SDRAM device.

- Configure MCR[DQSMD] bit to select the read clock source. Suggest to set it with 0x1 to reach high clock frequency.
- Configure IOCR register to choose chip select pins.
- Configure BMCR0/1 registers to adjust AXI bus access efficiency scheme.
- Configure Base Register 0/1/2/3 with base address, memory size and valid information.
- Configure INTEN and INTR registers if need to generate interrupt.
- Configure SDRAM Control Registers with valid settings that matchs SDRAM device.
- Initialize SDRAM device by IP command registers (IPCR0/1/2, IPCMD and IPTXDAT).
- Write and read operations can be triggered by AXI or IP command. However, AXI command is suggested.

## 25.6.2 NAND Application

This section provides the example sequences for NAND device.

- Configure IOCR register to choose chip select pins.
- Configure BMCR0/1 registers to adjust AXI bus access efficiency scheme.
- Configure Base Register 4/8 with base address, memory size and valid information.
- Configure INTEN and INTR registers if need to generate interrupt.
- Configure NAND Control Registers with valid settings that matchs NAND device.
- Configure DLL Control Register for synchronous mode.
- Initialize NAND device by IP command registers (IPCR0/1/2, IPCMD and IPTXDAT).
- For programming operation, need to open page by IP command. Then you can write data to the NAND buffer by IP or AXI bus.
- For read operation, need to open page by IP command. Then you can read data from the NAND buffer by IP or AXI bus.
- For erase operation, you should do it by IP command.

## 25.6.3 NOR Application

This section provides the example sequences for NOR device.

- Configure MCR[DQSMD] bit to select the read clock source for synchronous mode. Suggest to set it with 0x1 to reach high clock frequency.

- Configure IOCR register to choose chip select pins.
- Configure BMCR0/1 registers to adjust AXI bus access efficiency scheme.
- Configure Base Register 5 with base address, memory size and valid information.
- Configure INTEN and INTR registers if need to generate interrupt.
- Configure NOR Control Registers with valid settings that matchs NOR device.
- Initialize NOR device by IP command registers (IPCR0/1/2, IPCMD and IPTXDAT) if needed.
- Programming operation can be triggered by IP command only.
- Read operation can be triggered by AXI or IP command.

## 25.6.4 SRAM Application

This section provides the example sequences for SRAM device.

- Configure MCR[DQSMD] bit to select the read clock source for synchronous mode. Suggest to set it with 0x1 to reach high clock frequency.
- Configure IOCR register to choose chip select pins.
- Configure BMCR0/1 registers to adjust AXI bus access efficiency scheme.
- Configure Base Register 6 with base address, memory size and valid information.
- Configure INTEN and INTR registers if need to generate interrupt.
- Configure SRAM Control Registers with valid settings that matchs SRAM device.
- Initialize SRAM device by IP command registers (IPCR0/1/2, IPCMD and IPTXDAT) if needed.
- Write and read operations can be triggered by AXI or IP command.

## 25.6.5 DBI Application

This section provides the example sequences for Display Bus Interface.

- Configure IOCR register to choose chip select pins.
- Configure BMCR0/1 registers to adjust AXI bus access efficiency scheme.
- Configure Base Register 7 with base address, memory size and valid information.
- Configure INTEN and INTR registers if need to generate interrupt.
- Configure DBI Control Registers with valid settings that matchs DBI device.
- Write and read operations can be triggered by AXI or IP command.

## 25.7 Memory Map and Register Definition

This section includes the SEMC module memory map and detailed descriptions of all registers.

### 25.7.1 SEMC register descriptions

#### 25.7.1.1 SEMC memory map

SEMC base address: 402F\_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	Module Control Register (MCR)	32	RW	1000_0002h
4h	IO MUX Control Register (IOCR)	32	RW	0000_0000h
8h	Bus (AXI) Master Control Register 0 (BMCR0)	32	RW	0000_0000h
Ch	Bus (AXI) Master Control Register 1 (BMCR1)	32	RW	0000_0000h
10h - 30h	Base Register n (BR0 - BR8)	32	RW	0000_0000h
34h	DLL Control Register (DLLCR)	32	RW	0000_0100h
38h	Interrupt Enable Register (INTEN)	32	RW	0000_0000h
3Ch	Interrupt Register (INTR)	32	RW	0000_0000h
40h	SDRAM Control Register 0 (SDRAMCR0)	32	RW	0000_0C26h
44h	SDRAM Control Register 1 (SDRAMCR1)	32	RW	0099_4934h
48h	SDRAM Control Register 2 (SDRAMCR2)	32	RW	8000_0EEEh
4Ch	SDRAM Control Register 3 (SDRAMCR3)	32	RW	4080_8000h
50h	NAND Control Register 0 (NANDCR0)	32	RW	0000_0000h
54h	NAND Control Register 1 (NANDCR1)	32	RW	0000_0000h
58h	NAND Control Register 2 (NANDCR2)	32	RW	0001_0410h
5Ch	NAND Control Register 3 (NANDCR3)	32	RW	0000_0000h
60h	NOR Control Register 0 (NORCR0)	32	RW	0000_0000h
64h	NOR Control Register 1 (NORCR1)	32	RW	0000_0000h
68h	NOR Control Register 2 (NORCR2)	32	RW	0000_0000h
6Ch	NOR Control Register 3 (NORCR3)	32	RW	0000_0000h
70h	SRAM Control Register 0 (SRAMCR0)	32	RW	0000_0000h
74h	SRAM Control Register 1 (SRAMCR1)	32	RW	0000_0000h
78h	SRAM Control Register 2 (SRAMCR2)	32	RW	0000_0000h

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
7Ch	SRAM Control Register 3 (SRAMCR3)	32	RW	0000_0000h
80h	DBI-B Control Register 0 (DBICR0)	32	RW	0000_0000h

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved								WPOL1	WPOL0	Reserved					DQSMD
W									0	0	0	0	0	0	1	0
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

### 25.7.1.2.3 Fields

Field	Function
31-29 —	Reserved
28-24 BTO	<p>Bus timeout cycles</p> <p>The SEMC monitors AXI transactions in the queue. When it exceeds the timeout cycles, an AXIBUSERR interrupt is generated. The AXI Bus timeout is <math>255*2^{BTO}</math> clock cycles.</p> <ul style="list-style-type: none"> <li>00000b - 255*1</li> <li>00001b - 255*2</li> <li>11111b - 255*<math>2^{31}</math></li> </ul>
23-16 CTO	<p>Command Execution timeout cycles</p> <p>When Command Execution time exceeds the timeout cycles, an IPCMDERR or AXICMDERR interrupt is generated. When CTO is set to zero, timeout cycles is <math>256*1024</math> cycle. Otherwise timeout cycles is <math>CTO*1024</math> cycle.</p>
15-8 —	Reserved
7 WPOL1	<p>R/B# polarity for NAND device</p> <p>This bit configures the expected polarity of R/B# signal from NAND device.</p> <ul style="list-style-type: none"> <li>0b - R/B# polarity is not changed.</li> <li>1b - R/B# polarity is inverted.</li> </ul>
6 WPOL0	<p>WAIT/RDY polarity for SRAM/NOR</p> <p>This bit configures the expected polarity of WAIT/RDY signal from SRAM and NOR devices.</p> <ul style="list-style-type: none"> <li>0b - WAIT/RDY polarity is not changed.</li> <li>1b - WAIT/RDY polarity is inverted.</li> </ul>
5-3 —	Reserved
2 DQSMD	<p>DQS (read strobe) mode</p> <p>DQSMD controls the read clock source of SDRAM, NOR and SRAM in synchronous mode. When it set, the read clock is loopbacked from DQS pad, it benefits the read path timing, and can get high read clock frequency.</p>

Table continues on the next page...

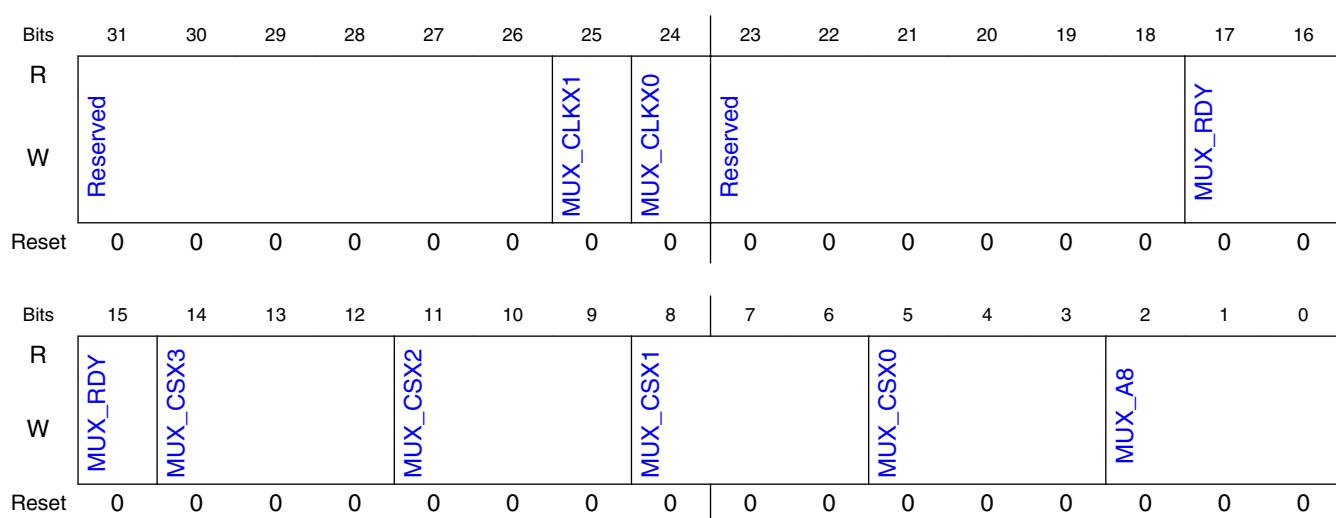

Field	Function
	0b - Dummy read strobe loopbacked internally 1b - Dummy read strobe loopbacked from DQS pad
1 MDIS	Module Disable When this bit set, the SEMC internal clock is stopped, and no function is available except register access. 0b - Module enabled 1b - Module disabled
0 SWRST	Software Reset Reset all internal logic in the SEMC except configuration registers. It is an auto clear bit. 0b - No reset 1b - Reset

### 25.7.1.3 IO MUX Control Register (IOCR)

#### 25.7.1.3.1 Offset

Register	Offset
IOCR	4h

#### 25.7.1.3.2 Diagram

#### 25.7.1.3.3 Fields

Field	Function
31-26	Reserved

Table continues on the next page...

## Memory Map and Register Definition

Field	Function
—	
25 MUX_CLKX1	SEMC_CLKX1 function selection  This field controls the clock source of SEMC_CLKX1 signal. 0b - NOR clock 1b - SRAM clock
24 MUX_CLKX0	SEMC_CLKX0 function selection  This field controls the clock source of SEMC_CLKX0 signal. 0b - NOR clock 1b - SRAM clock
23-18	Reserved
—	
17-15 MUX_RDY	SEMC_RDY function selection  This field controls the function of SEMC_RDY signal. 000b - NAND R/B# input 001b - SDRAM CS1 010b - SDRAM CS2 011b - SDRAM CS3 100b - NOR CE# 101b - SRAM CE# 110b - DBI CSX 111b - Reserved
14-12 MUX_CSX3	SEMC_CSX3 output selection  This field controls the function of SEMC_CSX3 signal. 000b - Reserved 001b - SDRAM CS1 010b - SDRAM CS2 011b - SDRAM CS3 100b - NAND CE# 101b - NOR CE# 110b - SRAM CE# 111b - DBI CSX
11-9 MUX_CSX2	SEMC_CSX2 output selection  This field controls the function of SEMC_CSX2 signal. 000b - Reserved 001b - SDRAM CS1 010b - SDRAM CS2 011b - SDRAM CS3 100b - NAND CE# 101b - NOR CE# 110b - SRAM CE# 111b - DBI CSX
8-6 MUX_CSX1	SEMC_CSX1 output selection  This field controls the function of SEMC_CSX1 signal. 000b - Reserved 001b - SDRAM CS1 010b - SDRAM CS2 011b - SDRAM CS3 100b - NAND CE# 101b - NOR CE# 110b - SRAM CE# 111b - DBI CSX

Table continues on the next page...

Field	Function
5-3 MUX_CSX0	SEMC_CSX0 output selection This field controls the function of SEMC_CSX0 signal. 000b - Reserved 001b - SDRAM CS1 010b - SDRAM CS2 011b - SDRAM CS3 100b - NAND CE# 101b - NOR CE# 110b - SRAM CE# 111b - DBI CSX
2-0 MUX_A8	SEMC_ADDR08 output selection This field controls the function of SEMC_ADDR08 signal. 000b - SDRAM Address bit 8 (A8) or NOR/SRAM Address bit 24 (A24) in ADMUX 16bit mode 001b - NAND CE# 010b - NOR CE# 011b - SRAM CE# 100b - DBI CSX 101-111b - SDRAM Address bit 8 (A8) or NOR/SRAM Address bit 24 (A24) in ADMUX 16bit mode

## 25.7.1.4 Bus (AXI) Master Control Register 0 (BMCR0)

### 25.7.1.4.1 Offset

Register	Offset
BMCR0	8h

### 25.7.1.4.2 Function

Queue A weight settings for AXI bus access to SDRAM, NAND, NOR, SRAM and DBI slaves.

#### NOTE

Please refer to [BMCR0 Registers Configuration](#)

## Memory Map and Register Definition

### 25.7.1.4.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved								WRWS							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	WSH								WAGE				WQOS			
W									0	0	0	0	0	0	0	0
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 25.7.1.4.4 Fields

Field	Function
31-24 —	Reserved
23-16 WRWS	Weight of slave hit with Read/Write Switch This weight score is valid when the queue command's slave is same as current executing command with read/write operation switch.
15-8 WSH	Weight of Slave Hit without read/write switch This weight score is valid when queue command's slave is the same as current executing command without read/write operation switch.
7-4 WAGE	Weight of AGE Each command in queue has an age score to indicate its wait period. The age score is multiplied by WAGE to get the weight score. Recommend to use non-zero value.
3-0 WQOS	Weight of QOS AXI bus access has AxQOS signal set, which is used as a priority indicator for the associated write or read transaction. A higher value indicates a higher priority transaction. AxQOS is multiplied by WQOS to get the weight score.

## 25.7.1.5 Bus (AXI) Master Control Register 1 (BMCR1)

### 25.7.1.5.1 Offset

Register	Offset
BMCR1	Ch

### 25.7.1.5.2 Function

Queue B weight settings for AXI bus access to SDRAM slave.

#### NOTE

Please refer to [BMCR1 Registers Configuration](#)

### 25.7.1.5.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	WBR								WRWS							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	WPH								WAGE				WQOS			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 25.7.1.5.4 Fields

Field	Function
31-24	Weight of Bank Rotation
WBR	This weight score is valid when queue command's bank is not same as current executing command.
23-16	Weight of slave hit without Read/Write Switch
WRWS	This weight score is valid when queue command's read/write operation is same as current executing command.
15-8	Weight of Page Hit
WPH	This weight score is valid when queue command's page hits current executing command.
7-4	Weight of AGE
WAGE	Each command in queue has an age signal to indicate its wait period. It is multiplied by WAGE to get the weight score. Recommend to use non-zero value.
3-0	Weight of QOS
WQOS	AXI bus access has AxQOS signal set, which is used as a priority indicator for the associated write or read transaction. A higher value indicates a higher priority transaction. AxQOS is multiplied by WQOS to get the weight score.

### 25.7.1.6 Base Register n (BR0 - BR8)

## Memory Map and Register Definition

### 25.7.1.6.1 Offset

For n = 0 to 8:

Register	Offset
BRn	10h + (n × 4h)

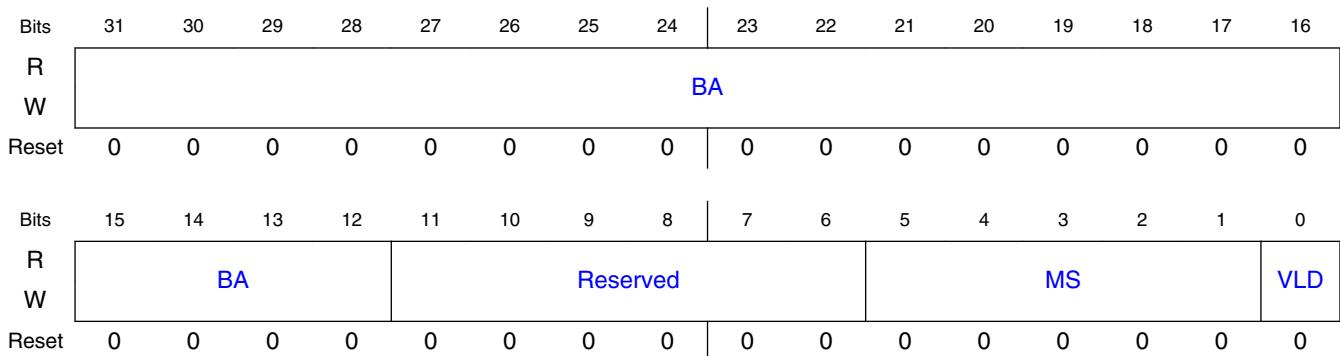

### 25.7.1.6.2 Function

Table 25-7 shows the detail information about the Base Registers.

**Table 25-7. Base Register Information**

Register	Reset Value	Purpose	Comments
BR0	0x8000001D	For SDRAM CS0	For AXI and IP commands
BR1	0x8400001C	For SDRAM CS1	For AXI and IP commands
BR2	0x8800001C	For SDRAM CS2	For AXI and IP commands
BR3	0x8C00001C	For SDRAM CS3	For AXI and IP commands
BR4	0x9E00001A	For NAND	For AXI command only
BR5	0x90000018	For NOR	For AXI and IP commands
BR6	0x98000018	For SRAM	For AXI and IP commands
BR7	0x9C00001A	For DBI-B	For AXI and IP commands
BR8	0x00000026	For NAND	For IP command only

### 25.7.1.6.3 Diagram

### 25.7.1.6.4 Fields

Field	Function
31-12 BA	Base Address

*Table continues on the next page...*

Field	Function
	This field determines high position 20 bits of SoC level base address. The low position 12 bits of the address are all zero. The base address must be within the SEMC range defined for the device memory map.
11-6 —	Reserved
5-1	Memory size
MS	<p>It defines the size of the memory. Memory size must be aligned with base address. Memory regions should be configured to avoid overlapping areas. Overlapping regions will cause bus errors.</p> <ul style="list-style-type: none"> <li>00000b - 4KB</li> <li>00001b - 8KB</li> <li>00010b - 16KB</li> <li>00011b - 32KB</li> <li>00100b - 64KB</li> <li>00101b - 128KB</li> <li>00110b - 256KB</li> <li>00111b - 512KB</li> <li>01000b - 1MB</li> <li>01001b - 2MB</li> <li>01010b - 4MB</li> <li>01011b - 8MB</li> <li>01100b - 16MB</li> <li>01101b - 32MB</li> <li>01110b - 64MB</li> <li>01111b - 128MB</li> <li>10000b - 256MB</li> <li>10001b - 512MB</li> <li>10010b - 1GB</li> <li>10011b - 2GB</li> <li>10100-11111b - 4GB</li> </ul>
0	Valid
VLD	<p>This bit controls whether the memory is valid or not.</p> <p>0b - The memory is invalid, can not be accessed. 1b - The memory is valid, can be accessed.</p>

### 25.7.1.7 DLL Control Register (DLLCR)

#### 25.7.1.7.1 Offset

Register	Offset
DLLCR	34h

#### 25.7.1.7.2 Function

This register provides the configuration fields for sample clock from DLL. It is for NAND only.

### 25.7.1.7.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved		OVRDVAL						OVRDEN		Reserved		SLVDLYTARGET		Reserved	
W															DLLRESET	
Reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0

### 25.7.1.7.4 Fields

Field	Function
31-15 —	Reserved
14-9 OVRDVAL	Override Value When OVRDEN is set, the delay cell number is OVRDVAL+1 for slave clock delay line.
8 OVRDEN	Override Enable Slave clock delay line delay cell number selection override enable. 0b - The delay cell number is not overridden. 1b - The delay cell number is overridden.
7 —	Reserved
6-3 SLVDLYTARGET	Delay Target for Slave The delay target for slave delay line is: ((SLVDLYTARGET+1) * 1/32 * clock cycle of reference clock (ipgclock).
2 —	Reserved
1 DLLRESET	DLL Reset Software can force a reset on DLL by setting this field to 0x1. This causes the DLL to lose lock and re-calibrate to detect an ref_clock half period phase shift. The reset action is edge triggered, so software need to clear this bit after setting this bit (no delay limitation). 0b - DLL is not reset. 1b - DLL is reset.
0 DLLEN	DLL calibration enable

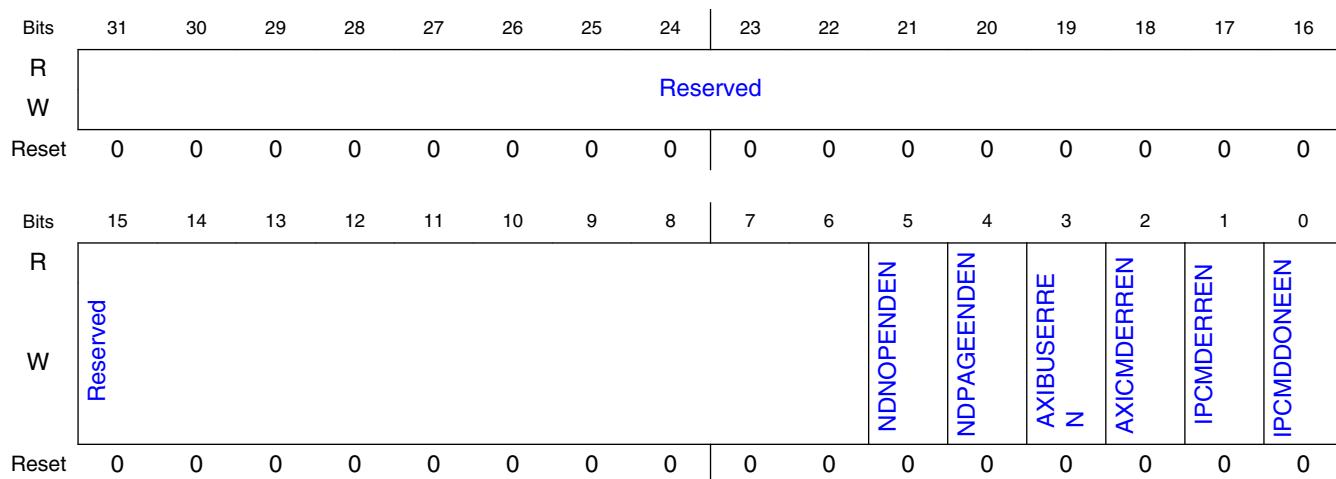

Field	Function
	When this bit is cleared, DLL calibration is disabled and the delay cell number in slave delay line is always 1. Please note that SLV delay line is overridden when OVRDEN bit is set and this bit field setting is ignored. 0b - DLL calibration is disabled. 1b - DLL calibration is enabled.

## 25.7.1.8 Interrupt Enable Register (INTEN)

### 25.7.1.8.1 Offset

Register	Offset
INTEN	38h

### 25.7.1.8.2 Diagram

### 25.7.1.8.3 Fields

Field	Function
31-6	Reserved
—	
5 NDNOPENDEN	NAND no pending AXI access interrupt enable This bit enable/disable the NDNOPEND interrupt generation. 0b - Interrupt is disabled 1b - Interrupt is enabled

Table continues on the next page...

## Memory Map and Register Definition

Field	Function
4 NDPAGEENDE N	NAND page end interrupt enable This bit enable/disable the NDPAGEEND interrupt generation. 0b - Interrupt is disabled 1b - Interrupt is enabled
3 AXIBUSERREN	AXI bus error interrupt enable 0b - Interrupt is disabled 1b - Interrupt is enabled
2 AXICMDERREN	AXI command error interrupt enable 0b - Interrupt is disabled 1b - Interrupt is enabled
1 IPCMDERREN	IP command error interrupt enable 0b - Interrupt is disabled 1b - Interrupt is enabled
0 IPCMDDONEEN	IP command done interrupt enable 0b - Interrupt is disabled 1b - Interrupt is enabled

## 25.7.1.9 Interrupt Register (INTR)

### 25.7.1.9.1 Offset

Register	Offset
INTR	3Ch

### 25.7.1.9.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R									Reserved								
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### 25.7.1.9.3 Fields

Field	Function
31-6 —	Reserved
5 NDNOPEND	NAND no pending AXI write transaction interrupt  This interrupt is generated when all pending AXI write transactions to NAND are finished. 0b - At least one NAND AXI write transaction is pending or no NAND write transaction is sent to the queue. 1b - All NAND AXI write pending transactions are finished.
4 NDPAGEEND	NAND page end interrupt  This interrupt is generated when the last address of one page in NAND device is written by AXI command. 0b - The last address of main space in the NAND is not written by AXI command. 1b - The last address of main space in the NAND is written by AXI command.
3 AXIBUSERR	AXI bus error interrupt  AXI Bus error interrupt is generated in following cases: <ul style="list-style-type: none"><li>• AXI address is invalid</li><li>• AXI write to NOR Flash</li><li>• AXI 8-bit write to 16-bit NAND Flash</li><li>• AXI 8-bit or 16-bit WRAP write/read</li></ul> 0b - No AXI bus error. 1b - AXI bus error occurs.
2 AXICMDERR	AXI command error interrupt  AXI command error interrupt is generated when AXI command execution times out. 0b - No AXI command error. 1b - AXI command error occurs.
1 IPCMDERR	IP command error done interrupt  IP command error interrupt is generated in following cases: <ul style="list-style-type: none"><li>• IP Command Address target invalid device space</li><li>• IP Command Code unsupported</li><li>• IP Command triggered when previous command not finished yet</li><li>• IP Command Execution timeout</li></ul> 0b - No IP command error. 1b - IP command error occurs.
0 IPCMDDONE	IP command normal done interrupt  It monitors whether IP command is done or not. 0b - IP command is not done. 1b - IP command is done.

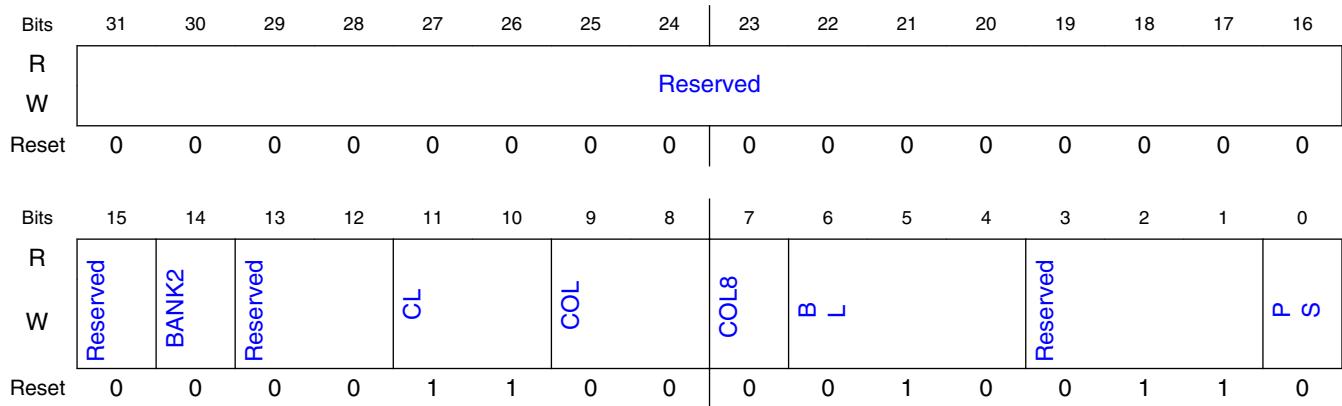

### 25.7.1.10 SDRAM Control Register 0 (SDRAMCR0)

## Memory Map and Register Definition

### 25.7.1.10.1 Offset

Register	Offset
SDRAMCR0	40h

### 25.7.1.10.2 Diagram

### 25.7.1.10.3 Fields

Field	Function
31-15 —	Reserved
14 BANK2	2 Bank selection bit This bit configures the bank numbers. 0b - SDRAM device has 4 banks. 1b - SDRAM device has 2 banks.
13-12 —	Reserved
11-10 CL	CAS Latency The CAS latency (CL) is the delay, in clock cycles, between the registration of a READ command and the availability of the output data. 00b - 1 01b - 1 10b - 2 11b - 3
9-8 COL	Column address bit number 00b - 12 01b - 11 10b - 10 11b - 9
7	Column 8 selection

Table continues on the next page...

Field	Function
COL8	This bit works with COL field to determine the column address bit number. 0b - Column address bit number is decided by COL field. 1b - Column address bit number is 8. COL field is ignored.
6-4 BL	Burst Length  The burst length determines the number of column locations that can be accessed for a given READ or WRITE command. 000b - 1 001b - 2 010b - 4 011b - 8 100b - 8 101b - 8 110b - 8 111b - 8
3-1 —	Reserved
0 PS	Port Size  The port size must be aligned with SDRAM data width. 0b - 8bit 1b - 16bit

## 25.7.1.11 SDRAM Control Register 1 (SDRAMCR1)

### 25.7.1.11.1 Offset

Register	Offset
SDRAMCR1	44h

### 25.7.1.11.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### 25.7.1.11.3 Fields

Field	Function
31-24 —	Reserved
23-20 ACT2PRE	ACTIVE to PRECHARGE minimum time The SEMC promises ACT2PRE+1 clock cycles delay between ACTIVE command to PRECHARGE/ PRECHARGE ALL command.
19-16 CKEOFF	CKE off minimum time The SEMC promises at least CKEOFF+1 clock cycles in self refresh mode. It helps to meet the minimum period request to remain in self refresh mode.
15-13 WRC	WRITE recovery time The SEMC promises WRC+1 clock cycles delay between WRITE command to PRECHARGE/ PRECHARGE ALL command. It helps to meet tWR timing requirement by SDRAM device.
12-8 RFRC	REFRESH recovery time The SEMC promises RFRC+1 clock cycles delay between AUTO REFRESH command to ACTIVE command. It helps to meet tRFC timing requirement by SDRAM device.
7-4 ACT2RW	ACTIVE to READ/WRITE delay The SEMC promises ACT2RW+1 clock cycles delay between ACTIVE command to READ/WRITE command. It helps to meet tRCD timing requirement by SDRAM device.
3-0 PRE2ACT	PRECHARGE to ACTIVE/REFRESH command wait time The SEMC promises PRE2ACT+1 clock cycles delay between PRECHARGE/PRECHARGE ALL command to ACTIVE/REFRESH command. It helps to meet tRP timing requirement by SDRAM device.

### 25.7.1.12 SDRAM Control Register 2 (SDRAMCR2)

#### 25.7.1.12.1 Offset

Register	Offset
SDRAMCR2	48h

## 25.7.1.12.2 Diagram

## 25.7.1.12.3 Fields

Field	Function
31-24 ITO	SDRAM idle timeout  The SEMC closes all opened pages if the SDRAM idle time lasts more than idle timeout period. SDRAM is considered idle when there is no AXI Bus transfer and no SDRAM command pending. 0000000b - IDLE timeout period is 256*Prescale period. 00000001-1111111b - IDLE timeout period is ITO*Prescale period.
23-16 ACT2ACT	ACTIVE to ACTIVE delay  The SEMC promises ACT2ACT+1 clock cycles delay between ACTIVE command to ACTIVE command. It helps to meet tRRD timing requirement by SDRAM device.
15-8 REF2REF	REFRESH to REFRESH delay  The SEMC promises REF2REF+1 clock cycles delay between REFRESH command to REFRESH command. It helps to meet tRFC timing requirement by SDRAM device.
7-0 SRRC	SELF REFRESH recovery time  The SEMC promises SRRC+1 clock cycles delay between SELF REFRESH command to any subsequent command. SDRAM device may have limitation on self refresh recovery time. It help to meet the wait time from exiting self refresh mode to sending new command to device.

## 25.7.1.13 SDRAM Control Register 3 (SDRAMCR3)

### 25.7.1.13.1 Offset

Register	Offset
SDRAMCR3	4Ch

### 25.7.1.13.2 Diagram

R	PRESCALE								Reserved				REBL			REN
W	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 25.7.1.13.3 Fields

Field	Function
31-24 UT	<p>Urgent refresh threshold</p> <p>Urgent refresh threshold is used to handle urgent refresh request. Urgent refresh timer starts to count when normal refresh request is asserted but not handled by the controller yet. When the urgent refresh timer count up to the threshold, urgent refresh request is sent to the controller. The priority of urgent refresh is higher than any pending AXI or IP command to SDRAM, so it can be handled by the controller at the first time.</p> <p><b>NOTE:</b> Refresh request is considered as urgent refresh request when urgent threshold is no less than refresh period.            00000000b - 256*(Prescaler period)            00000001-11111111b - UT*(Prescaler period)</p>
23-16 RT	<p>Refresh timer period</p> <p>Refresh timer period is the threshold for SDRAM normal refresh request. The normal refresh request is sent to the controller when the refresh timer count up to it. The priority of normal refresh request is lower than any pending AXI or IP command to SDRAM.</p> <p>00000000b - (256+1)*(Prescaler period)            00000001-11111111b - (RT+1)*(Prescaler period)</p>
15-8 PRESCALE	<p>Prescaler period</p> <p>Prescaler period is used as a clock cycle count unit for refresh and bus idle timer period.</p> <p>00000000b - (256*16+1) clock cycles            00000001-11111111b - (PRESCALE*16+1) clock cycles</p>
7-4 —	Reserved
3-1 REBL	<p>Refresh burst length</p> <p>The SEMC can send multiple AUTO REFRESH commands in one burst when REBL is set to non-zero. The number of AUTO REFRESH command in one burst is listed below.</p> <ul style="list-style-type: none"> <li>000b - 1</li> <li>001b - 2</li> <li>010b - 3</li> <li>011b - 4</li> <li>100b - 5</li> <li>101b - 6</li> <li>110b - 7</li> </ul>

Table continues on the next page...

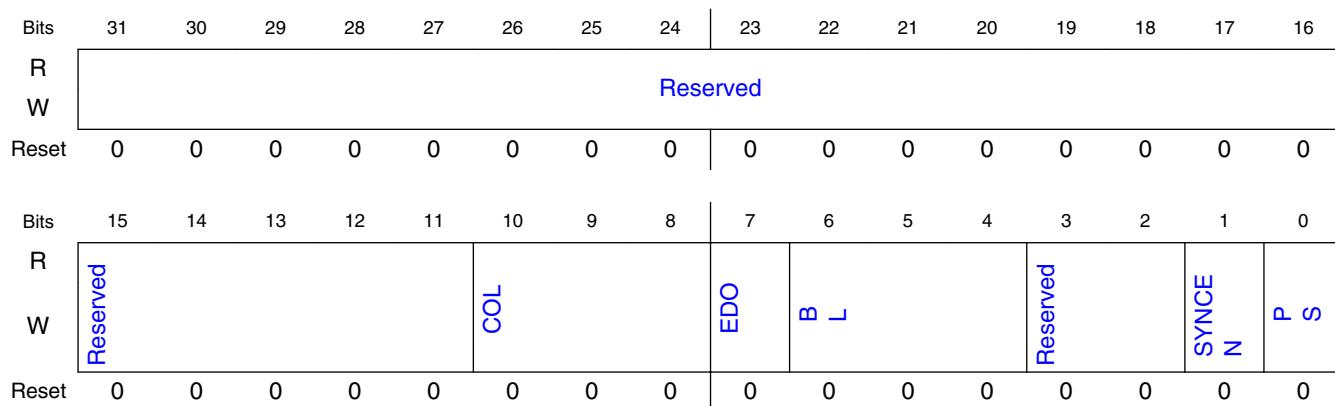

Field	Function
	111b - 8
0 REN	Refresh enable The SEMC sends AUTO REFRESH command automatically when REN bit is set. The AUTO REFRESH command interval is decided by UT, RT and PRESCALE bits. 0b - The SEMC does not send AUTO REFRESH command automatically 1b - The SEMC sends AUTO REFRESH command automatically

### 25.7.1.14 NAND Control Register 0 (NANDCR0)

#### 25.7.1.14.1 Offset

Register	Offset
NANDCR0	50h

#### 25.7.1.14.2 Diagram

#### 25.7.1.14.3 Fields

Field	Function
31-11 —	Reserved
10-8 COL	Column address bit number 000b - 16 001b - 15 010b - 14 011b - 13

Table continues on the next page...

## Memory Map and Register Definition

Field	Function
	100b - 12 101b - 11 110b - 10 111b - 9
7 EDO	EDO mode enabled It defines the read access timing in asynchronous mode. 0b - EDO mode disabled 1b - EDO mode enabled
6-4 BL	Burst Length The burst length determines the number of column locations that can be accessed for a given READ or WRITE command. 000b - 1 001b - 2 010b - 4 011b - 8 100b - 16 101b - 32 110b - 64 111b - 64
3-2 —	Reserved
1 SYNCEN	Synchronous Mode Enable It defines the access mode. 0b - Asynchronous mode is enabled. 1b - Synchronous mode is enabled.
0 PS	Port Size The port size must be aligned with NAND Flash data width. 0b - 8bit 1b - 16bit

### 25.7.1.15 NAND Control Register 1 (NANDCR1)

#### 25.7.1.15.1 Offset

Register	Offset
NANDCR1	54h

### 25.7.1.15.2 Diagram

### 25.7.1.15.3 Fields

Field	Function
31-28 CEITV	CE# interval time CE# interval minimum time is CEITV+1 clock cycles.
27-24 TA	Turnaround time Turnaround time is TA+1 clock cycles. Both the SEMC and Device do not drive Data Lines to avoid bus confliction. This field applied to ASYNC mode only.
23-20 REH	RE# high time RE# high time is REH+1 clock cycles. This field applied to ASYNC mode only.
19-16 REL	RE# low time RE# low time is REL+1 clock cycles. This field applied to ASYNC mode only.
15-12 WEH	WE# high time WE# high time is WEH+1 clock cycles in ASYNC mode. It is used as command and address hold time in SYNC mode. WEH must be even number in SYNC mode, and command/address hold time is WEH clock cycles.
11-8 WEL	WE# low time WE# low time is WEL+1 clock cycles in ASYNC mode. It is used as command and address setup time in SYNC mode. WEL must be even number in SYNC mode, and command/address setup time is WEL+2 clock cycles.
7-4 CEH	CE# hold time CE# hold minimum time is CEH+1 clock cycles. CEH must be odd number in SYNC mode. CE# hold time may be larger than this time to wait all read data sampled.
3-0 CES	CE# setup time CE# setup time is CES+1 clock cycles. CES must be odd number in SYNC mode.

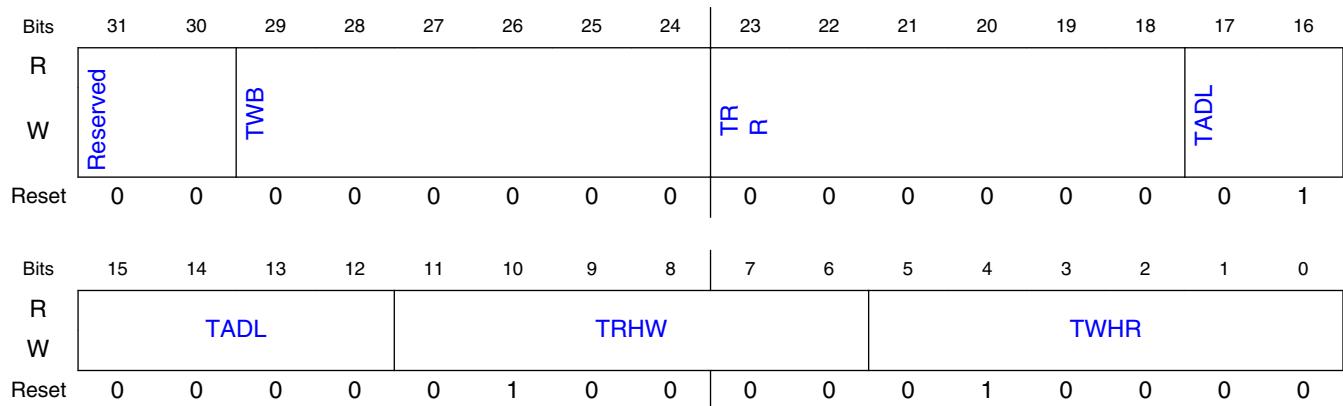

### 25.7.1.16 NAND Control Register 2 (NANDCR2)

## Memory Map and Register Definition

### 25.7.1.16.1 Offset

Register	Offset
NANDCR2	58h

### 25.7.1.16.2 Diagram

### 25.7.1.16.3 Fields

Field	Function
31-30 —	Reserved
29-24 TWB	WE# high to busy time WE# high to busy time is TWB+1 clock cycles
23-18 TRR	Ready to RE# low time Ready to RE# low minimum time is TRR+1 clock cycles. Actual time may be 1 or 2 clock cycles more than this because of synchronizer logic. This field applied to ASYNC mode only.
17-12 TADL	Address cycle to data loading time Address to data loading time is TADL+1 clock cycles. Timing for TADL begins in the address cycle on the final rising edge of WE#, and ends with the first rising edge of WE# for data input.
11-6 TRHW	RE# high to WE# low time RE# high to WE# low time is TRHW+1 clock cycles
5-0 TWHR	WE# high to RE# low time WE# high to RE# low time is TWHR+1 clock cycles in ASYNC mode. TWHR represents command, address or data input cycle to data output clock cycles in SYNC mode. The delay is TWHR+2 clock cycles and TWHR must be even.

Field	Function
31-28 REH	RE high time RE high time is REH+1 clock cycles. This field applied to ASYNC mode only.
27-24 REL	RE low time RE low time is REL+1 clock cycles. This field applied to ASYNC mode only.
23-20 WEH	WE high time WE high time is WEH+1 clock cycles. This field applied to ASYNC mode only.
19-16 WEL	WE low time WE low time is WEL+1 clock cycles. This field applied to ASYNC mode only.
15-12 AH	Address hold time Address hold time is AH+1 clock cycles for ASYNC mode. Address hold time is AH clock cycles for SYNC mode.
11-8 AS	Address setup time Address setup time is AS+1 clock cycles
7-4 CEH	CE hold time CE Hold time is CEH+1 clock cycles

Table continues on the next page...

## Memory Map and Register Definition

Field	Function
	This field determines the minimum hold time. Actual hold time may be larger in order to wait all read data sampled.
3-0	CE setup time
CES	CE setup time is CES+1 clock cycles.

## 25.7.1.24 SRAM Control Register 2 (SRAMCR2)

### 25.7.1.24.1 Offset

Register	Offset
SRAMCR2	78h

### 25.7.1.24.2 Function

This register configures SRAM device 0

### 25.7.1.24.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RDH				CEITV				RD				LC			
W	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 25.7.1.24.4 Fields

Field	Function
31-28	Read hold time
RDH	Read hold time is RDH clock cycles. This field applied to SYNC mode only.
27-24	CE# interval time
CEITV	CE# interval minimum time is CEITV+1 clock cycles.
23-20	Read time

Table continues on the next page...

Field	Function
RD	Read time is RD+1 clock cycles. This field applied to SYNC mode only.
19-16	Latency count
LC	Latency count is LC clock cycles. This field applied to SYNC mode only.
15-12	Address to write data hold time
AWDH	Address to write data hold time is AWDH clock cycles. This field applied to ASYNC mode only.
11-8	Turnaround time
TA	Turnaround time is TA+1 clock cycles. Both the SEMC and Device do not drive Data Lines to avoid bus confliction. This field applied to ASYNC mode only.
7-4	Write Data hold time
WDH	Write data hold time is WDH clock cycles. This field applied to SYNC mode only.
3-0	Write Data setup time
WDS	Write data setup time is WDS+1 clock cycles. This field applied to SYNC mode only.

## 25.7.1.25 SRAM Control Register 3 (SRAMCR3)

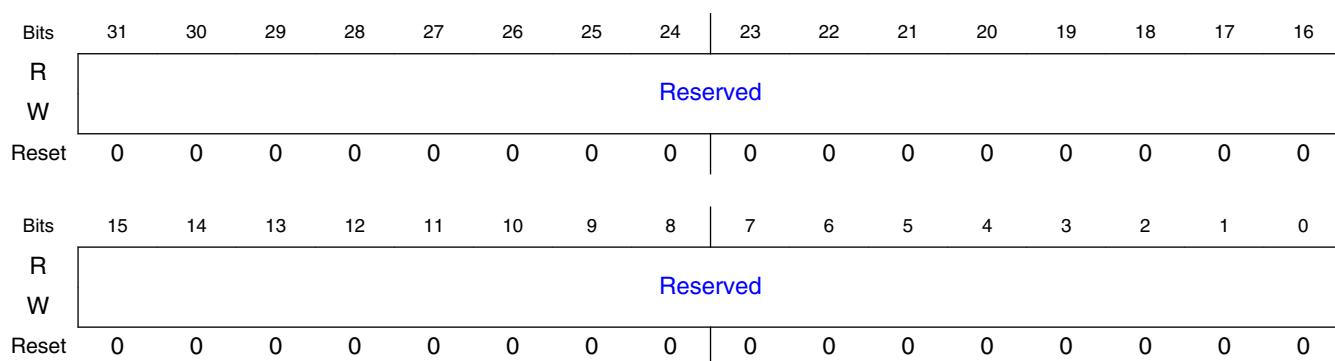

### 25.7.1.25.1 Offset

Register	Offset
SRAMCR3	7Ch

### 25.7.1.25.2 Function

This register configures SRAM device 0

### 25.7.1.25.3 Diagram

### 25.7.1.25.4 Fields

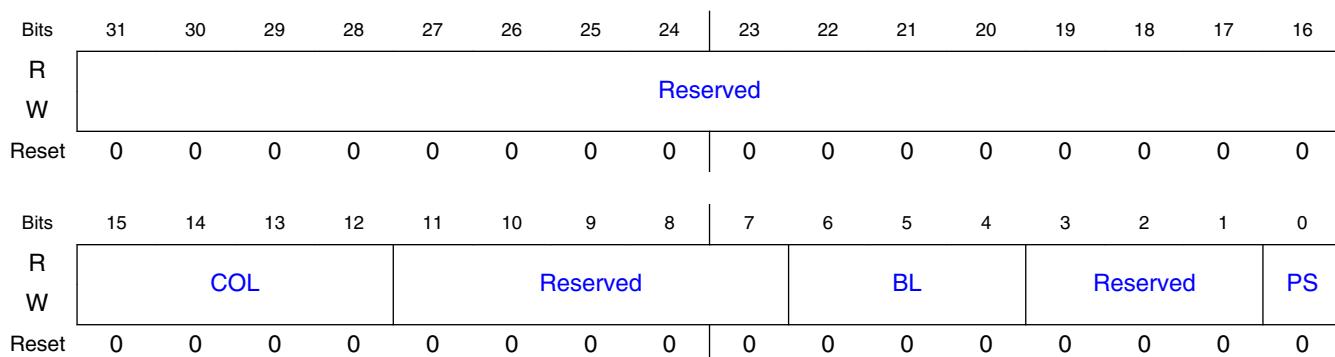

Field	Function
31-0	Reserved
—	

### 25.7.1.26 DBI-B Control Register 0 (DBICR0)

#### 25.7.1.26.1 Offset

Register	Offset
DBICR0	80h

#### 25.7.1.26.2 Diagram

#### 25.7.1.26.3 Fields

Field	Function
31-16	Reserved
—	
15-12 COL	Column Address bit width 0000b - 12 Bits 0001b - 11 Bits 0010b - 10 Bits 0011b - 9 Bits 0100b - 8 Bits 0101b - 7 Bits 0110b - 6 Bits 0111b - 5 Bits

Table continues on the next page...

## Ultra Secured Digital Host Controller (uSDHC)

### 26.1 Chip-specific uSDHC information

Table 26-1. Reference links to related information

Topic	Related module(s)	Reference
System memory map	-	<a href="#">System Memory Map</a>
Clocking	CCM	<a href="#">Clock Management</a> <a href="#">Clock Control Module (CCM)</a>
Power management	PMU	<a href="#">Power Management</a> <a href="#">Power Management Unit</a>
Signal multiplexing	IOMUX	<a href="#">External Signals and Pin Multiplexing</a> <a href="#">IOMUX</a>
Interrupts, DMA Events and XBAR Assignments	-	<a href="#">Interrupts, DMA Events and XBAR Assignments</a>

On this device, for data transfer modes, uSDHC1 only supports 1-bit and 4-bit modes, while uSDHC2 can support 1-bit, 4-bit and 8-bit modes.

#### NOTE

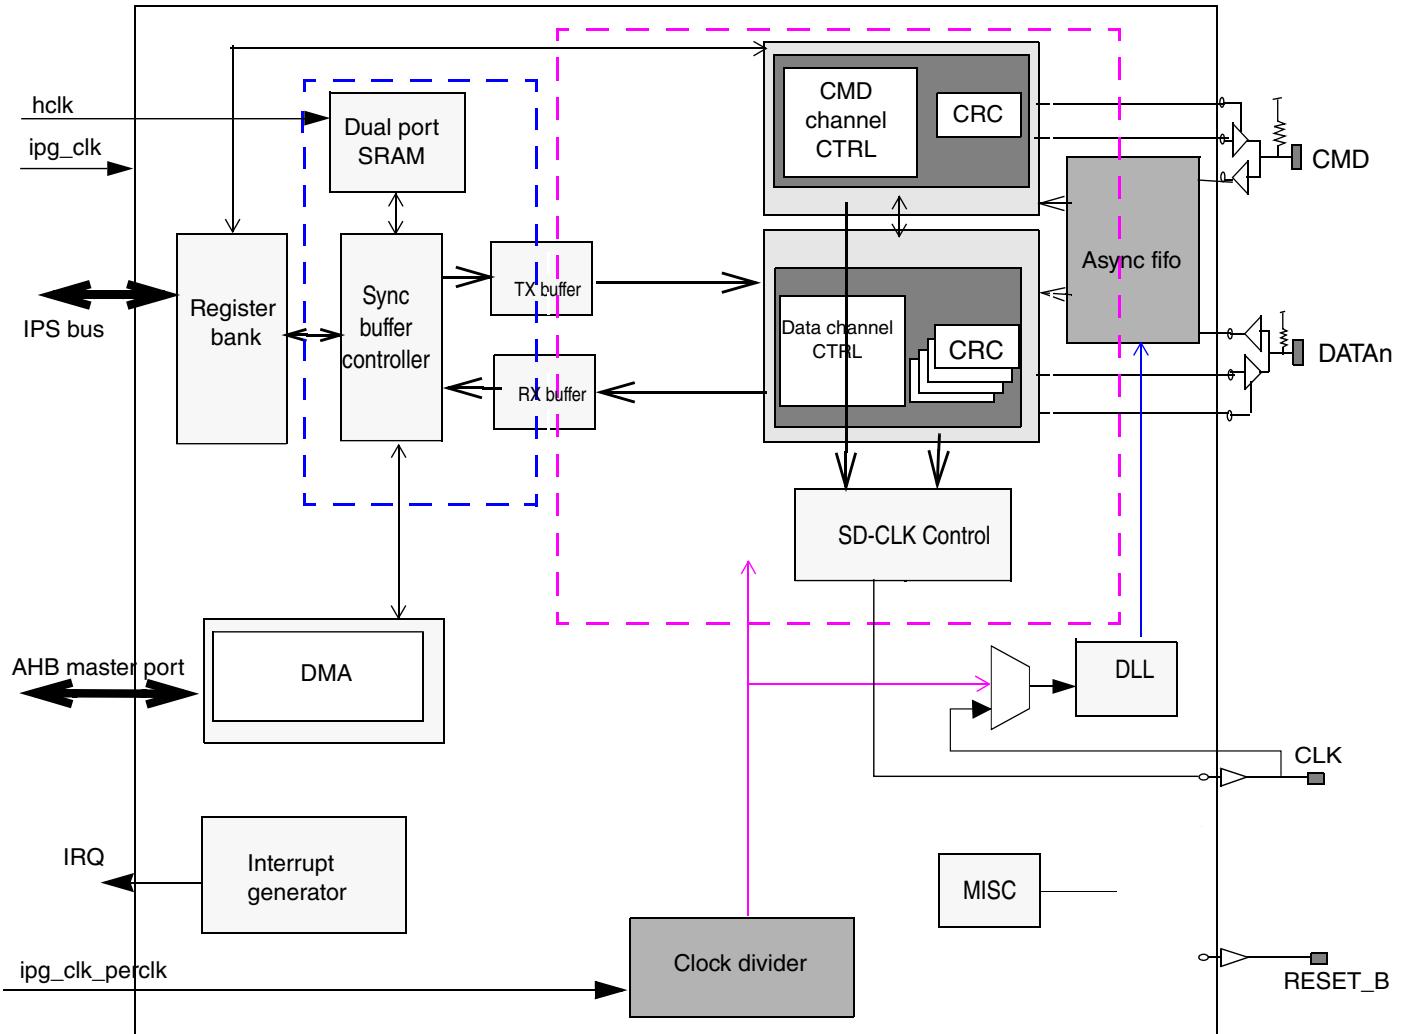

HS400 mode is not supported on this device.

### 26.2 Overview

The Ultra Secured Digital Host Controller (uSDHC) provides the interface between the host system and the SD/SDIO/MMC cards, as shown in [Figure 26-2](#). The module acts as a bridge, passing host bus transactions to the SD/SDIO/MMC cards by sending commands and performing data accesses to/from the cards. It handles the SD/SDIO/MMC protocols at the transmission level.

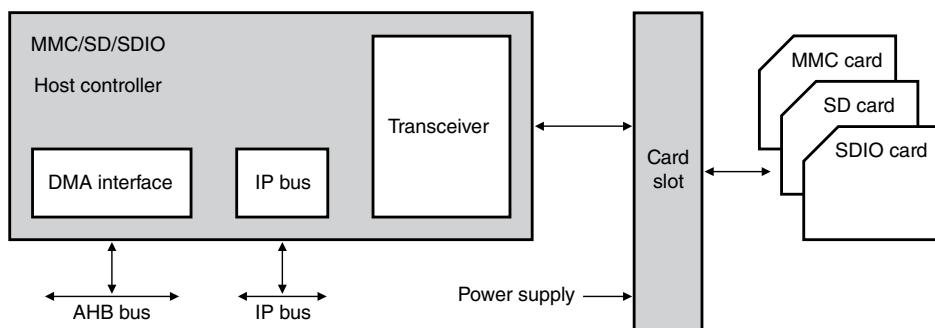

## 26.2.1 Block Diagram

The following figure illustrates the block diagram for uSDHC.

**Figure 26-1. uSDHC block diagram**

The figure below shows the System connection of uSDHC:

**Figure 26-2. System connection of uSDHC**

The following are brief descriptions of the cards supported by uSDHC:

- The Multi Media Card (MMC) is a universal low-cost data storage and communication media designed to cover a wide array of applications including mobile video and gaming. Previous MMC cards were based on a 7-pin serial bus with a single data pin, while the new high speed MMC communication is based on an advanced 11-pin serial bus designed to operate in the low-voltage range.
- The Secure Digital Card (SD) is an evolution of the old MMC technology. It is specifically designed to meet the security, capacity, performance, and environmental requirements inherent in newly emerging audio and video consumer electronic devices. The physical form factor, pin assignment, and data transfer protocol are backward compatible with the old MMC (with some additions).
- Under the SD protocol, system connection can be categorized into memory card, I/O card, and combo card, which have both memory and I/O functions. The memory card invokes a copyright protection mechanism that complies with the security of the SDMI standard. The I/O card, which is also known as SDIO card, provides high-speed data I/O with low-power consumption for mobile electronic devices. For the sake of simplicity, the next figure does not show cards with reduced size or mini cards.

## 26.2.2 Features

The list given below shows the features of the uSDHC module:

- Conforms to the SD Host Controller Standard Specification version 2.0/3.0
- Compatible with the MMC System Specification version 4.2/4.3/4.4/4.41/4.5
- Compatible with the SD Memory Card Specification version 3.0 and supports the Extended Capacity SD Memory Card
- Compatible with the SDIO Card Specification version 2.0/3.0
- Designed to work with SD Memory, miniSD Memory, SDIO, miniSDIO, SD Combo, MMC, MMC plus, and MMC RS cards
- Card bus clock frequency up to 208 MHz
- Supports 1-bit/4-bit SD and SDIO modes, and 1-bit/4-bit/8-bit MMC modes
  - Up to 832 Mbps of data transfer for SDIO cards using four parallel data lines in the Single Data Rate (SDR) mode
  - Up to 400 Mbps of data transfer for SDIO card using four parallel data lines in the Dual Data Rate (DDR) mode
  - Up to 832 Mbps of data transfer for SDXC cards using four parallel data lines in the Single Data Rate (SDR) mode
  - Up to 400 Mbps of data transfer for SDXC card using four parallel data lines in the Dual Data Rate (DDR) mode

- Up to 1600 Mbps of data transfer for MMC cards using eight parallel data lines in the Single Data Rate (SDR) mode
- Up to 832 Mbps of data transfer for MMC cards using eight parallel data lines in the Dual Data Rate (DDR) mode
- Supports single block/multi-block read and write
- Supports block sizes of 1 ~ 4096 bytes
- Supports both synchronous and asynchronous abort
- Supports pause during the data transfer at block gap
- Supports SDIO Read Wait and Suspend Resume operations
- Supports Auto CMD12 for multi-block transfer
- Host can initiate non-data transfer command while data transfer is in progress
- Allows cards to interrupt the host in 1-bit and 4-bit SDIO modes; also supports interrupt period
- Embodies a fully configurable 128x32-bit FIFO for read/write data
- Supports internal DMA capabilities
- Supports voltage selection by configuring vendor-specific register bit
- Supports Advanced DMA to perform linked memory access

**NOTE**

This block can support all the above-listed speed mode and maximum data throughput. However, these may be specific to the device. See the corresponding chip-specific information or the device data sheet for accurate details.

## **26.3 Functional description**

The following sections provide a brief functional description of the major system blocks, including the data buffer, DMA AHB interface, register bank as well as IP Bus interface, dual-port memory wrapper, data/command controller, clock and reset manager, and clock generator.

### **26.3.1 Modes and operations**

#### **26.3.1.1 Data transfer modes**

The uSDHC module can select the following modes for data transfer:

- SD 1-bit
- SD 4-bit

- MMC 1-bit
- MMC 4-bit
- MMC 8-bit
- Identification mode (up to 400 kHz)
- MMC full-speed mode (up to 26 MHz)
- MMC high-speed mode (up to 52 MHz)
- MMC HS200 mode(up to 200 MHz)
- MMC DDR mode (52 MHz both edges)
- SD/SDIO full-speed mode (up to 25 MHz)
- SD/SDIO high-speed mode (up to 50 MHz)
- SD/SDIO UHS-I mode(up to 208 MHz in SDR mode, up to 50 MHz in the DDR mode)

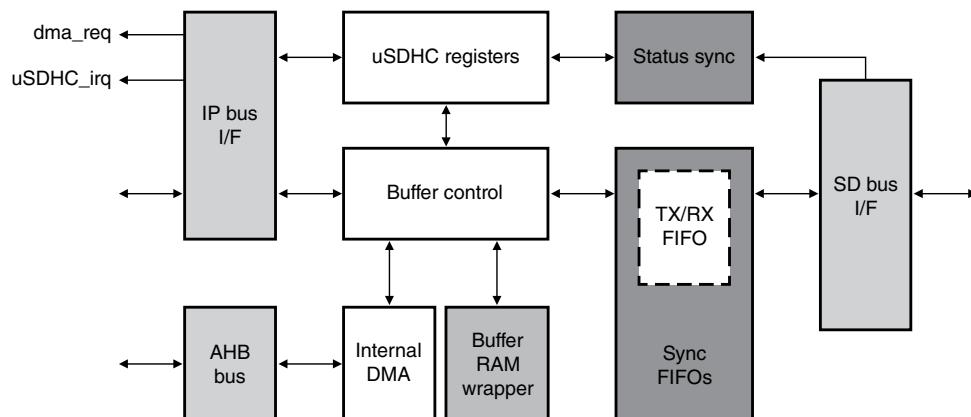

### NOTE

This block can support all the above listed speed mode and maximum clock frequency. However, these may be specific to the device. See the corresponding chip-specific information or the device data sheet for accurate details.

#### 26.3.2 Data buffer

The uSDHC module uses one configurable data buffer to transfer data between the system bus (IP bus or advanced high-performance bus (AHB) bus) and the SD card in an optimized manner, maximizing throughput between the two clock domains (IP peripheral clock and the master clock).

The buffer is used as a temporary storage for transferring data between the host system and the card. The watermark levels for read and write are both configurable and can range between 1 to 128 words. The burst lengths for read and write are also configurable and can range between 1 to 31 words. The next figure provides the uSDHC buffer scheme.

**Figure 26-3. uSDHC buffer scheme**

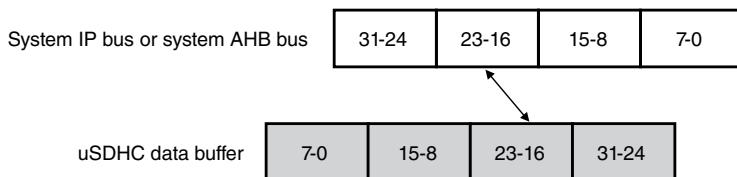

Here are 2 transfer modes to access the data buffer:

- CPU polling mode:
  - For a host-read operation, when the number of words received in the buffer meets or exceeds the RD\_WML watermark value, by polling the BRR bit, the host driver can read the Buffer Data Port register to fetch the amount of words set in the RD\_WML register from the buffer. The write operation is similar. For more information on the process of writing operation, see [Write operation sequence](#).
- Internal DMA mode (includes simple and advanced DMA accesses):
  - The internal DMA access, either by simple or advanced DMA, is over the AHB bus.

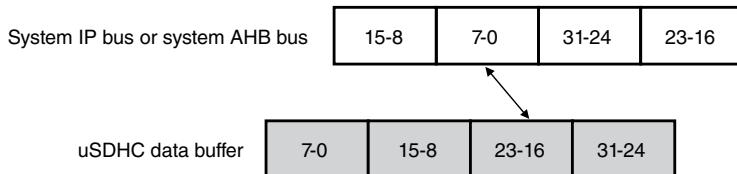

For a read operation, when there are more words in the buffer than the amount set in the RD\_WML register, the internal DMA starts fetching data over the AHB bus. Except for INCR4 and INCR8, the burst type is always the INCR mode and the burst length depends on the shortest of the following factors:

- Burst length configured in the burst length field of the Watermark Level register
- Watermark level boundary
- Block size boundary
- Data boundary configured in the current descriptor (if the ADMA is active)
- 1 KB address boundary defined in the AHB protocol

The Write operation functions in a similar manner—sequential and contiguous access is necessary to ensure that the pointer address value is correct. Random or skipped access is not possible. The byte order, by reset, is little endian mode. The actual byte order is swapped inside the buffer, according to the endian mode configured by software (see the following figures). For a host write operation, the byte order is swapped after the data is fetched from the buffer and ready to send to the SD Bus. For a host read operation, the byte order is swapped before the data is stored in the buffer.

**Figure 26-4. Data swap between system bus and uSDHC data buffer in the byte little endian mode**

**Figure 26-5. Data swap between system bus and uSDHC data buffer in half word big endian mode**

### 26.3.2.1 Write operation sequence

There are 2 ways to write data into the buffer when the user transfers data to the card:

- Processor core polling through the BWR bit in the Interrupt Status register (interrupt or polling)
- Internal DMA

When the internal DMA is not used, the DMAEN bit in the Transfer Type register is not set when the command is sent, uSDHC asserts a DMA request when the amount of buffer space exceeds the value set in the WR\_WML register and is ready for receiving new data. At the same time, uSDHC sets the BWR bit. The buffer write ready interrupt is generated if it is enabled by software.

When internal DMA is used, uSDHC does not inform the system before all the required number of bytes are transferred (if no error is encountered). When an error occurs during the data transfer, uSDHC aborts the data transfer and abandons the current block. The host driver should read the contents of the DMA System Address register to obtain the starting address of the abandoned data block. If the current data transfer is in multi-block mode, uSDHC does not automatically send CMD12, even though the AC12EN bit in the Transfer Type register is set. The host driver sends CMD12 in this scenario and restarts the write operation from that address. It is recommended that a software reset for Data be applied before the transfer is restarted.

The uSDHC module does not start data transmission until the buffer has been filled with the number of words set in the WR\_WML register. If the buffer is empty and the host system does not write data in time, uSDHC stops the CLK to avoid the data buffer underrun situation.

### **26.3.2.2 Read operation sequence**

There are 2 ways to read data from the buffer when the data is received from the card:

- Processor core polling through the BRR bit in the Interrupt Status register (interrupt or polling)
- Internal DMA

When internal DMA is not used (DMAEN bit in Transfer Type register is not set when the command is sent), uSDHC asserts a DMA request when the amount of data exceeds the value set in the RD\_WML register, which is available and ready for system fetching data. At the same time, uSDHC sets the BRR bit. The buffer read ready interrupt is generated if it is enabled by the software.

When internal DMA is used, uSDHC does not inform the system before all the required number of bytes are transferred (if no error is encountered). When an error occurs during the data transfer, uSDHC aborts the data transfer and abandons the current block. The host driver should read the content of the DMA System Address register to get the starting address of the abandoned data block. If the current data transfer is in multi-block mode, uSDHC does not automatically send CMD12, even though the AC12EN bit in the Transfer Type register is set. The host driver sends CMD12 in this scenario and restarts the read operation from that address. It is recommended that a software reset (in register RSTD) for data be applied before the transfer is restarted.

For any write transfer mode, uSDHC does not start data transmission until the number of words set in the RD\_WML register are in buffer. If the buffer is full and the host system does not read data in time, uSDHC stops the CLK to avoid the data buffer overrun situation.

### **26.3.2.3 Data buffer and block size**

In the uSDHC module, the data buffer can hold up to 128 words (32-bit) and the watermark levels for write and read can be configured accordingly. The user needs to know the buffer size for the buffer operation during a data transfer to utilize it in the most optimized way.

For both read and write, the watermark level can range between 1 to 128 words. For both read and write, the burst length can range from 1 to 31 words. The host driver may configure the value according to the system and requirement.

During a multi-block data transfer, the block length can be set to any value between 1 and 4096 bytes, satisfying the requirements of the external card. The only restriction is from the external card, which can be limited in size or support of a partial block access (which is not the integer times of 512 bytes).

As uSDHC treats each block individually, for block sizes which are not multiples of four (not word-aligned), stuffed bytes are required at the end of each block. For example, if the block size is 7 bytes and there are 12 blocks to write, the software side must write twice for each block. For each block, the ending byte is abandoned by uSDHC because it only sends 7 bytes to the card and picks data from the following system write, resulting in 24 beats of write access in total.

#### 26.3.2.4 Dividing large data transfer

This SDIO command CMD53 definition limits the maximum data size of data transfers according to the following formula:

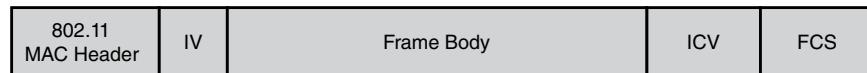

$$\text{Max data size} = \text{Block size} \times \text{Block count}$$

The length of a multiple block transfer needs to be in multiples of block size. If the total data length cannot be divided evenly into a multiple of the block size, then there are two options to transfer the data. These two options depend on the function and the card design. Option 1 is for the host driver to split the transaction. The remainder of the block size data is then transferred by using a single block command at the end. Option 2 is to add dummy data in the last block to fill the block size. For option 2, the card must manage the removal of the dummy data.

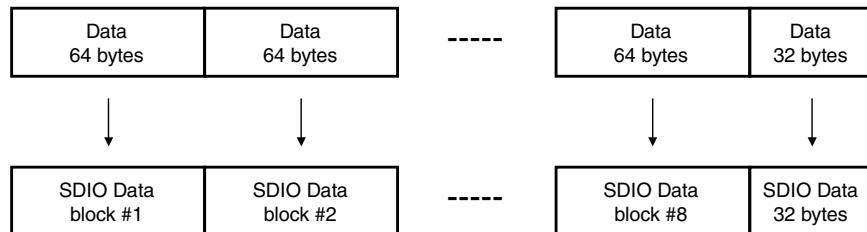

See the figure below for an example showing the division of large data transfers, assuming a kind of WLAN SDIO card that only supports a block size of up to 64 bytes. Although uSDHC supports a block size of up to 4096 bytes, the SDIO can only accept a block size of less than 64 bytes, so the data must be divided (see the example below).

## Functional description

544 Bytes WLAN Frame

WLAN Frame is divided equally into 64 byte blocks plus the remainder 32 bytes

Eight 64 byte blocks are sent in Block Transfer mode and the remainder 32 bytes are sent in Byte Transfer mode

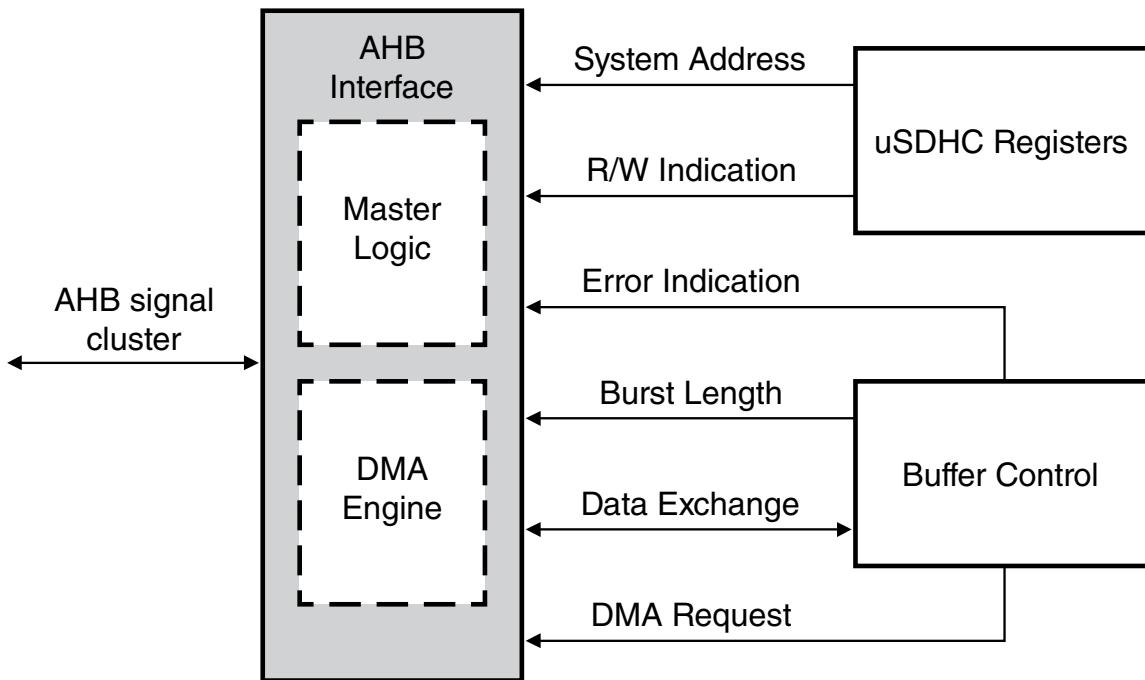

**Figure 26-6. Example for dividing large data transfers**

### 26.3.3 DMA AHB interface

The internal DMA implements a DMA engine and the AHB master. When the internal DMA is enabled, but the BWR and BRR bits are set if the BWRSEN and BRRSEN bits have been set in the Interrupt Status Enable register.

See the figure below for an illustration of the DMA AHB interface block.

**Figure 26-7. DMA AHB interface block**

#### 26.3.3.1 Internal DMA request

If the watermark level requirement is met in data transfer or if the last data of current block is ready in the data buffer, and the Internal DMA is enabled, the data buffer block sends a DMA request to AHB interface.

The delay in response from the internal DMA engine depends on the system AHB bus loading and the priority assigned to uSDHC. The DMA engine does not respond to the request during its burst transfer, but is ready to serve as soon as the burst is over. The data buffer de-asserts the request if the data buffer space (for write) or bytes in data buffer is smaller than the watermark level. Upon access to the buffer by internal DMA, the data buffer updates its internal buffer pointer, and when the watermark level is satisfied or the last data of the current block is ready in the data buffer, another DMA request is sent.

The data transfer is in the block unit, and the subsequent watermark level is always automatically set as the remaining number of words. For instance, for a multi block data read with each block size of 31 bytes, and the burst length set to six words (24 bytes). After the first burst transfer, if there are greater than or equal to two words in the buffer, which might contain some data of the next block), another DMA request is sent. This is because the remaining number of words to transfer for the current block is  $\text{ceiling}((31 - 6 * 4) / 4) = 2$ . The uSDHC module reads two words out of the buffer, with seven valid bytes and one stuffed byte.

### **26.3.3.2 DMA burst length**

Just like a CPU polling access, the DMA burst length for the internal DMA engine can range between 1 to 16 words. The actual burst length for the DMA depends on the lesser of the configured burst length or the remaining words of the current block. See the example in [Internal DMA request](#). After six words are read, the burst length is two words, then the next burst length is six words. This is because the next block starts, which is 31 bytes, more than six words. The host driver may take this variable burst length into account. It is also acceptable to configure the burst length as the divisor of the block size, so that each time the burst length is the same.

### **26.3.3.3 AHB master interface**

It is possible that the internal AHB DMA engine could fail during the data transfer. Upon detection of an AHB bus error during DMA transfer, the DMA engine stops the transfer and goes to the idle state. At that point, the internal data buffer stops receiving incoming data and sending out data. The DMAE bit in the Interrupt Status register is generated to host CPU to report a bus error condition.

After the DMAE interrupt is received, the software sends a CMD12 to abort the current transfer and read the DS\_ADDR bits of the DMA System Address register to get the starting address of the corrupted block. After the DMA error is fixed, the software should apply a data reset and restart the transfer from this address to recover the corrupted block.

### **26.3.3.4 ADMA engine**

In the SD host controller standard, a new DMA transfer algorithm called the Advanced DMA (ADMA) is defined. For simple DMA, after the page boundary is reached, a DMA interrupt is generated and the new system address is programmed by the host driver.

The ADMA defines the programmable descriptor table in the system memory. The host driver can calculate the system address at the page boundary and program the descriptor table before executing ADMA. It reduces the frequency of interrupts to the host system. Therefore, higher speed DMA transfers could be realized because the host MCU intervention is not needed during long DMA-based data transfers.

There are two types of ADMA in host controller: ADMA1 and ADMA2. ADMA1 can support data transfer of 4KB aligned data in system memory, and ADMA2 eliminates the restriction so that the data of any location and any size can be transferred in system memory. Their formats of Descriptor Table are different.

ADMA can recognize all kinds of descriptors defined in SD host controller Standard, and if the "End" flag is detected in the descriptor, ADMA stops after this descriptor is processed.

#### **26.3.3.4.1 ADMA concept and descriptor format**

ADMA1 includes the following descriptors:

- Valid/invalid descriptor
- Nop descriptor
- Set data length descriptor
- Set data address descriptor
- Link descriptor
- Interrupt flag and end flag in descriptor

ADMA2 includes the following descriptors:

- Valid/invalid descriptor
- Nop descriptor
- Rsv descriptor (new in ADMA2)
- Set data length and address descriptor
- Link descriptor
- Interrupt flag and end flag in descriptor

ADMA starts read/write operation after it reaches the tran state, using the data length and data address analyzed from most recent descriptor(s).

For ADMA1, the valid data length descriptor is the last set type descriptor before the tran type descriptor. Every tran type descriptor triggers a transfer, and the transfer data length is extracted from the most recent set type descriptor. If there is no set type descriptor after the previous Trans descriptor, the data length is the value for previous transfer, or 0 if no set descriptor is ever met.

## Functional description

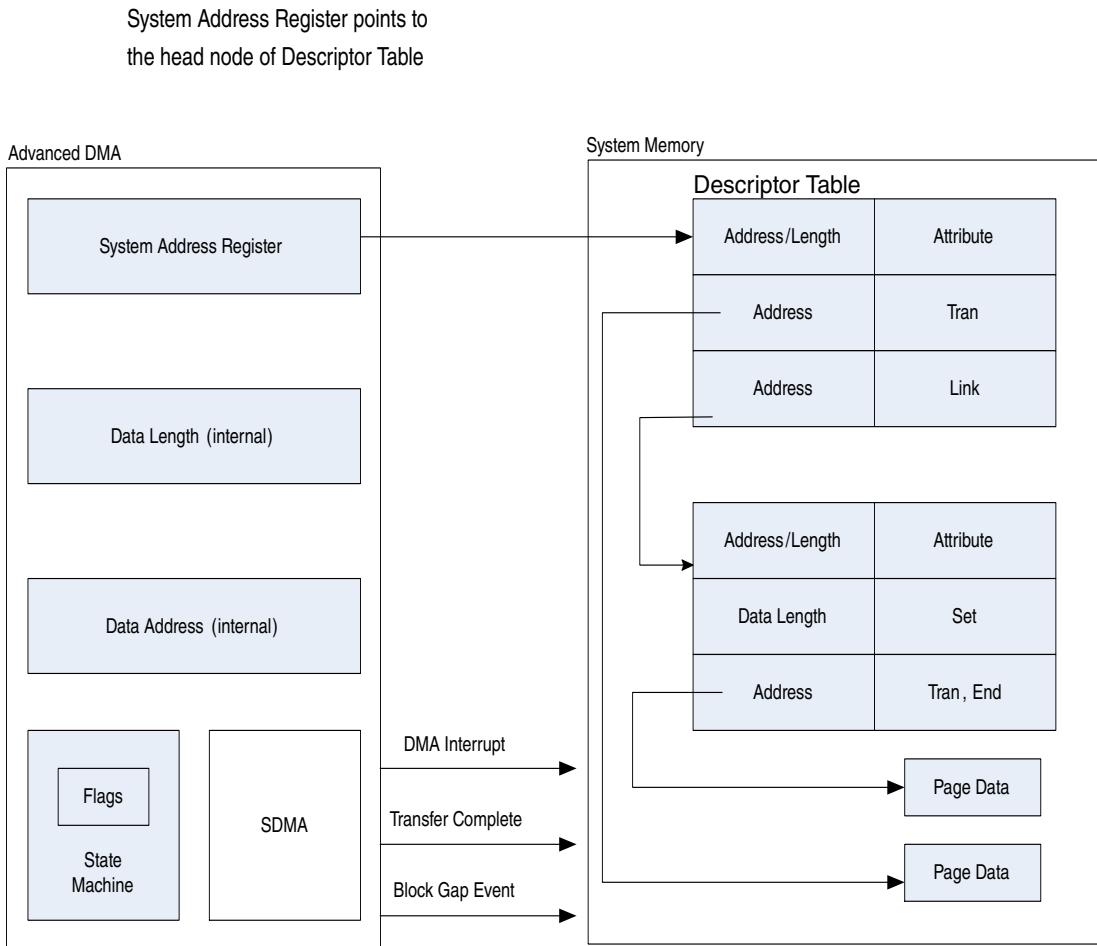

For ADMA2, the tran type descriptor contains both data length and transfer data address, so the tran type descriptor itself can start a data transfer.

See the figure below for the format of the descriptor table for ADMA1.

Address/ Page Field		Address/ Page Field		Attribute Field												
31		12	11	6	5	4	3	2	1	0						
Address or Data Length		000000		Act 2	Act 1	0	Int	End	Valid							
Act 2		Act1		Symbol	Comment		31- 28		27- 12							
0		0		Nop	No Operation		Don't Care									
0		1		Set	Set Data Length		0000	Data Length								
1		0		Tran	Transfer Data		Data Address									
1		1		Link	Link Descriptor		Descriptor Address									
Valid	Valid = 1 indicates this line of descriptor is effective. If Valid = 0 generate ADMA Error Interrupt and stop ADMA.															
End	End = 1 indicates current descriptor is the ending one.															
Int	Int = 1 generates DMA Interrupt when this descriptor is processed.															

**Figure 26-8. Format of the ADMA1 descriptor table**

See the figure below for the concept and access method of the descriptor table for ADMA1.

**Figure 26-9. Concept and access method of the ADMA1 descriptor table**

The figure below explains the ADMA2 format. ADMA2 deals with the lower 32-bit first, and then the higher 32-bit. If the 'Valid' flag of descriptor is 0, it ignores the higher 32-bit. The Address field should be set to word aligned (lower 2-bit is always set to 0). Data length is in byte unit.

## Functional description

Address Field		Length		Reserved		Attribute Field						
63	32	31	16	15	06	05	04	03	02	01	00	
32-bit Address		16-bit length		0000000000		Act 2	Act 1	0	Int	End	Valid	

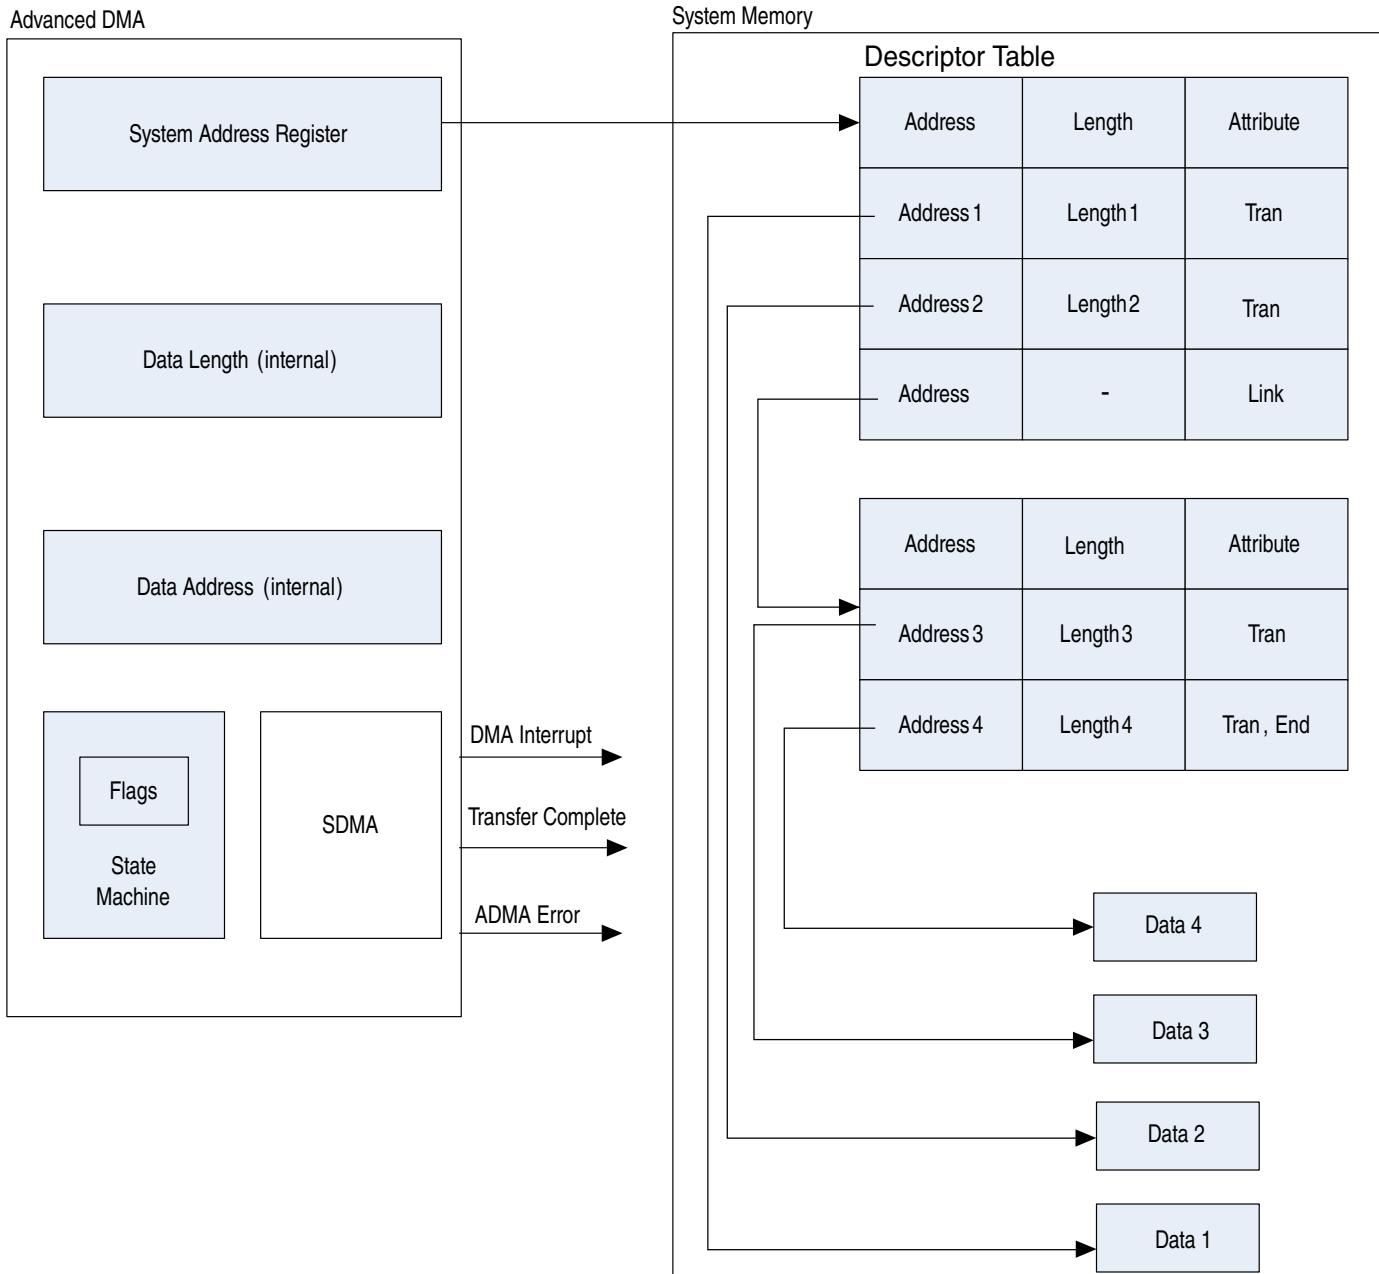

Act 2	Act1	Symbol	Comment	Operation
0	0	Nop	No Operation	Don't Care
0	1	Rsv	Reserved	Same as Nop. Read this line and go to next one
1	0	Tran	Transfer Data	Transfer data with address and length set in this descriptor line
1	1	Link	Link Descriptor	Link to another descriptor

Valid	Valid = 1 indicates this line of descriptor is effective. If Valid = 0 generate ADMA Error Interrupt and stop ADMA.
End	End = 1 indicates current descriptor is the ending one.
Int	Int = 1 generates DMA Interrupt when this descriptor is processed.

**Figure 26-10. Format of the ADMA2 descriptor table**

See the figure below for the concept and access method of the descriptor table for ADMA2.

System Address Register points to  
the head node of Descriptor Table

**Figure 26-11. Concept and access method of the ADMA2 descriptor table**

#### 26.3.3.4.2 ADMA interrupt

If the interrupt flag descriptor is set, ADMA generates an interrupt according to various types of descriptors.

For ADMA1:

- Set type of descriptor: interrupt is generated when data length is set.
- Tran type descriptor: interrupt is generated when this transfer is complete.
- Link type of descriptor: interrupt is generated when new descriptor address is set.
- Nop type of descriptor: interrupt is generated just after this descriptor is fetched.

For ADMA2:

- Tran type of descriptor: interrupt is generated when this transfer is complete.
- Link type of descriptor: interrupt is generated when new descriptor address is set.
- Nop/Rsv type of descriptor: interrupt is generated just after this descriptor is fetched.

#### **26.3.3.4.3 ADMA error**

The ADMA stops whenever an error is encountered. These errors include:

- Fetching descriptor error
- AHB response error
- Data length mismatch error

An ADMA descriptor error is generated when it fails to detect a "valid" flag in the descriptor. If an ADMA descriptor error occurs, the interrupt is not generated even if the "Interrupt" flag of this descriptor is set.

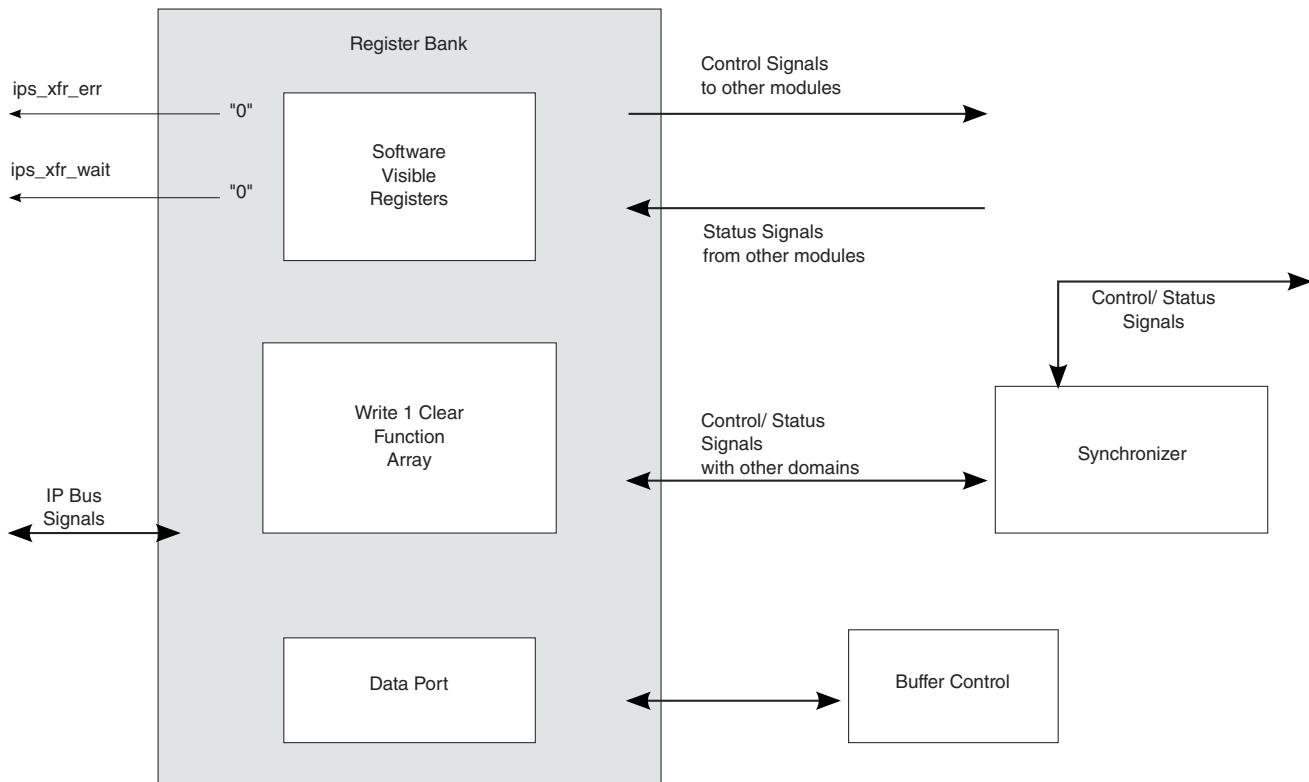

When BLKCNTE bit is set, data length set in register BLK\_ATT must be equal to the whole data length set in descriptor, otherwise data length mismatch error is generated.

When BLKCNTE bit is not set, then the whole data length set in descriptor is a multiple of block lengths; otherwise, when data set in the descriptor nodes are not performed at block boundaries, then data mismatch errors occur.

#### **26.3.4 Register bank with IP bus interface**

Register accesses through the IP bus interface are on the register bank.

See the figure below for the block diagram.

**Figure 26-12. Register bank diagram**

Only a 32-bit access is allowed, and no partial read/write is supported; therefore, all accesses are word aligned.

Access to an unimplemented address within the register memory map space does not generate a transfer error.

#### 26.3.4.1 SD protocol unit

The SD protocol unit deals with all SD protocol affairs.

The SD protocol unit performs the following functions:

- Acts as the bridge between the internal buffer and the SD bus
- Sends the command data as well as its argument serially
- Stores the serial response bit stream into corresponding registers
- Detects the bus state on the CMD/DAT lines
- Monitors the interrupt from the SDIO card
- Asserts the read wait signal
- Gates off the SD clock when buffer is announcing danger status

The SD protocol unit consists of four submodules:

- SD control misc
- Command control
- Data control
- Clock control

#### 26.3.4.2 SD control misc

In the SD control misc unit:

- The card detection (including DATA3 for card detection) and card interrupt are implemented.
- The module monitors the signal level on all the eight data lines and the command lines. It directly routes the level values into the register bank.

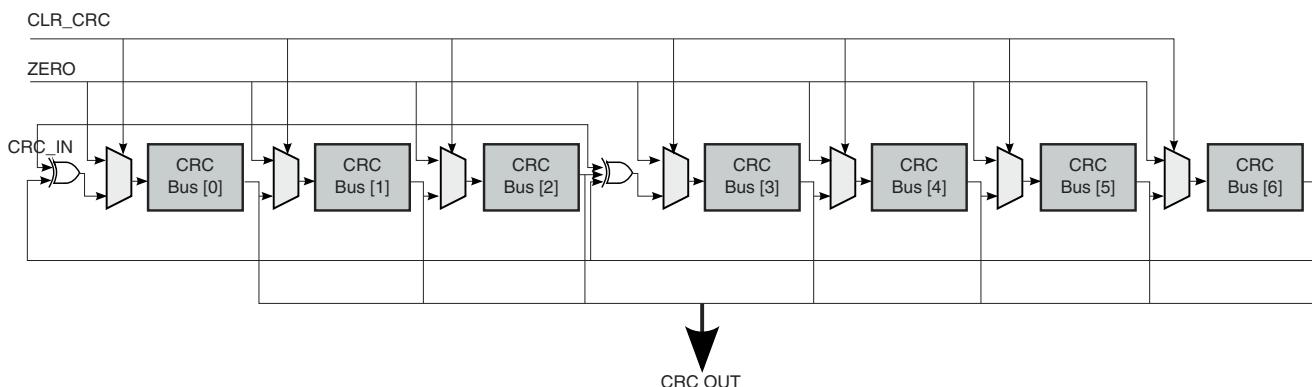

#### 26.3.4.3 SD clock control
